All communications regarding the course, as well as applications for admission, should be addressed to: The Dean of the School of Medicine, 630 West 168th

Street, New York 32, N.Y.

Dr. Edward S. Godfrey, Jr., New York State Commissioner of Health, has been elected president of the State Provincial Health Authorities of North America.

The first civilian Chinese to be naturalized here since the Chinese exclusion acts were repealed last December took the oath to become an American citizen from Federal Judge John C. Knox. He is Dr. Rupert C. Sancho, 45 years old. His Spanish name is a result of his Roman Catholic religion and his birth in Trinidad.

Dr. Sancho's speedy naturalization was possible because he had made formal declaration in 1930 of his intention to obtain United States citizenship. The physician was permitted at that time to file his declaration in order to comply with New York State laws governing the practice of medicine. He had taken his medical degree at Howard University the year before, and after completing his internship began to practice medicine here in 1930.\*

Oneida County

Dr. Franklin B. Peck, of Indianapolis, Indiana, was the speaker at the April meeting of the county society, which was held in the Hotel Utica on April 11. The title of his address was "The Clinical and Experimental Aspects of Penicillin." Discussion was opened by Capt. Carlos Julia of Rhoads General Hospital, Utica.

Dinner was served at 7:00 P.M. and the meeting

was called to order at 8:00 p.m.

"Office Gynecology, Diagnosis and Treatment," was the subject of a talk by Dr. Arthur J. Wallingford given at the meeting of the Utica Academy of Medicine on April 20 at the Hotel Utica. Wallingford is professor of gynecology at Albany Medical School. Discussion of his paper was opened by Dr. William Hale, Jr., of Utica. Dinner was served preceding the meeting.

Capt. Werner Hamburger, of Utica, formerly psychiatrist at Rhoads General Hospital, is now on the staff of an Army general hospital in England.

Educated at the University of Berlin and its medical college, Dr. Hamburger came to Utica in 1935 and was senior physician at the Utica State Hospital before entering the Army Medical Corps a year ago. He was assigned to Rhoads Hospital last summer and remained there until his transfer to a hospital unit at Fort Dix in December.

Dr. C. E. Troutman, assistant officer in the Utica district office, State Department of Health, has been transferred to the New York office.

### Ontario County

Frank L. Winsor

The second 1944 quarterly meeting of the county society was held at the Clifton Springs Sanitarium and Clinic on April 11. The program consisted of a

business meeting, a dinner, and a scientific session.

Dr. P. V. Newland, of Clifton Springs, gave a paper on "Arthritis," and members of the staff of the Sanitarium and Clinic presented a number of clinical

### Orange County

Dr. Warren B. Andrews, a practicing physician in Newburgh for forty years, has retired from practice. Dr. and Mrs. Andrews will move to Bethlehem, Connecticut, where they will make their home.

Dr. Andrews began his practice in Newburgh in September, 1904, after serving one year as assistant physician on the staff of the Hudson River State Hospital at Poughkeepsie. From 1906 until 1934 he served continuously, except for a few months' sick leave, as physician to the Newburgh City and Town Home.

Dr. Andrews is a past president of the Newburgh Bay Medical Society, a past president of the Orange County Medical Society, and a member of the New

York State Medical Society.\*

Newburgh Bay Medical Society went on record at a meeting on March 21 in hearty approval of having Newburgh be the pioneer center for demonstration of treating the city's water supply with fluorine as a protection against decay of teeth. A representative of the State Department of Health explained the project to members, who voted commendation to the City Council for its favorable reception of the proposal.\*

### Westchester County

Members of the Westchester County Medical Society were invited to be guests at a regular meeting of the Putnam County Medical Society on Wednesday evening, April 5, at the Gypsy Trail Country Club, Carmel, New York. A program on "Progress in Gastrointestinal Diseases" was presented by Dr. Henry Lax, internist, and Dr. Sandor Rado, psychiatrist. Supper was served at 7:00 P.M. and the scientific program began at 8:00 P.M.

## Aids in Relieving Blocked Sinuses

continuation of ciliary motion for a long period of time.

Sulmefrin may be administered by spray, drops or tamponage. It is supplied in 1-oz. dropper packages and 1-pint bottles. The solution is pink-tinted.

Sulmefrin-for intranasal treatment of

SINUSITIS
RHINITIS
PHARYNGITIS
LARYNGITIS

\* "Sulmefrin" (Reg. U. S. Pat. Off.) is a trade-mark of E. R. Squibb & Sons.

Sulmefrin contains desoxyephedronium sulfathiazole—a combination having the antibacterial properties of sulfathiazole with the proved vasoconstrictive action of ephedrine-like compounds.

Clinical studies have shown that Sulmefrin facilitates drainage and ventilation, generally producing prompt and prolonged vasoconstriction without such side-effects as sneezing, tachycardia or nervousness. It is mildly alkaline (pH approx. 9.0) and this, according to Turnbull, is preferable for nasal medication because (1) of high antibacterial activity in the pH range 8 to 10, and (2) it allows

### Hospital News

### May 12 Is National Hospital Day

'ONVINCED that the American public is eager to learn more about the functions and prob-lems of community hospitals, Frank J. Walter, president of the American Hospital Association, has announced that the theme of this year's National Hospital Day, May 12, will be "Hospitals

in the Third War Year."
"It is important that the people of this country understand the current problems of their hospitals and that they are made more aware of the services the hospitals perform for them," said Mr. Walter. "The extreme shortage of trained hospital personnel as a handicap to normal performance on behalf of its home community is being overcome by the majority of hospitals. Intensive volunteer and fulltime employee recruiting will be of assistance in calling to the attention of the average citizen the ideals of the voluntary hospital and, if volunteer appeals are heeded by a sufficient number of people, one of the greatest war difficulties will be partially solved," declared Mr. Walter.

In keeping with the spirit of the times, the Association plans a National Hospital Day emphasis on the continuance of cooperative relations with

government agencies, study of postwar hospitalization needs, a continued interest in veterans' physical rehabilitation programs, and expanded facilities for an interchange of technical advances in hospital science. "The necessity of careful planning by hospitals and government prior to any radical changes in the hospital system in this country is indicated by the successful development of our American hospitals through research and mutual cooperation," stated Mr. Walter.

Many hospital employees and hospital auxiliary volunteer groups contemplate soliciting pledges from community members to purchase war bonds which will supply medical equipment to the armed forces. "This additional effort is an indication of hospital willingness to assume an even larger share of the nation's responsibility during the war," stated George Bugbee, executive secretary of the American

Hospital Association.

Mr. Bugbee estimated that a considerable amount of support of this year's National Hospital Day celebration will be forthcoming from governmental agencies and civic-minded industrial and business leaders.

### Government Hospitals Need Occupational Therapists

WHILE on battle fronts scattered throughout the world our armed forces are concentrating on winning the war, in Army and veterans' hospitals here in the United States trained occupational therapists are among those bending their efforts toward winning the peace.

These therapists are erasing the ravages of war by the systematic rehabilitation of injured bodies and minds. Some of the war-wounded are reconditioned for further service in the Army; others are fitted for useful civilian work in a normal en-

As increasing numbers of injured soldiers return to the hospitals, more and more occupational therapists are needed to aid in their adjustment to normal

In greatest demand are experienced graduates of accredited occupational therapy schools. perience should be in hospitals acceptable to the American Medical Association. For some posi-

tions, however, college training in psychology and in arts and crafts or trades and industries, or experience as a junior aide in veterans' hospitals may be substituted for training in occupational therapy schools. Other positions will be filled by inexperienced graduates of occupational therapy schools.

The salary range of these positions is \$1,970 to \$2,433 a year, including overtime pay. Those appointed at \$1,970 will be trainees for a period of eighteen months; those appointed at \$2,190 and \$2,433 will administer occupational therapy under medical and general supervision, in Army and veterans' hospitals.

There are no age limits and no written tests, but applicants must be physically capable of performing the duties involved. Persons now using their highest skills in war work should not apply. Federal appointments are made in accordance with War Manpower Commission policies and employment stabilization programs.

### Nurses' Organizations to Meet in June

THIS biennial convention year the American Nurses' Association, the National League of Nursing Education, and the National Organization for Public Health Nursing are holding meetings jointly in Buffalo, with headquarters hotels designated as follows: ANA—Hotel Statler; NLNE—Hotel Lafayette; NOPHN—Hotel Buffalo. Dates set for the meetings are June 5, 6, 7, and 8,

Hotel reservations may be made through Mr. A. J. Morgan, Manager, Buffalo Convention Bureau, 602 Genesee Building, Buffalo, New York

No program sessions will be held during the four-day meetings, and no arrangements will be made for special breakfasts, luncheons, or dinners.

Delegates who attend the meetings are urged: (1) to make early reservations for sleeping rooms. No person should leave home for Buffalo who does not have written confirmation of a hotel reserva-

tion; (2) to purchase and have in their possession, before leaving home, return railroad tickets and pullman or other reservations.

The tentative schedule for the meetings provides for business meetings of the ANA and NOPHN, including business sessions of sections, and for special

conferences of the NLNE.

Two joint evening sessions are planned at which will be presented the programs of the National Nursing Council for War Service, the Nurse Education Division of the U.S. Public Health Service, the Procurement and Assignment Service for Nurses, and the American Red Cross Nursing Service

Chairman of General Arrangements for the meetings is Mrs. Tessa Klein, 181 Franklin Street, Buffalo, New York.

## Nethacetin

Brand of Sympathomimetic Anodyne Tablets

Relieves the symptoms—pain, headache, nervous strain.

Relieves the etiological factor—abnormal uterine contractions.

By combining a new sympathomimetic amine with established analgesic drugs, Nethacetin provides the physician with a safe, effective means of relieving both pain and uterine spasm of primary dysmenorrhea.

Jounula. Each Nethacetin Tablet contains 33 gr. Nethamine (brand of methylethylamino-phenylpropanol) hydrochloride, 312 grs. acetophenetidin and 2 grs. acetylsalicylic acid.

Nethamine increases the tone of uterine muscle tissue while inhibiting individual contractions. It is superior to ephedrine in this respect, although its pressor action and central stimulating effect are much less. Therefore, reactions such as sleeplessness and nervousness usually do not follow administration of Nethacetin Tablets.

Clinically Effective. Published clinical studies show Nethacetin 85% effective in the symptomatic management of primary dysmenorrhea.

**Docage.** One tablet every hour or two until relief is obtained. Usually not more than three tablets are required for each period.

Bottles of 100 and 1000

### Hospital Census Shows Enormous Increase

A N ALL-TIME record of 15,374,698 patients, exclusive of newborn babies and outpatients, were admitted to hospitals in the United States during 1943, the American Medical Association's annual census of hospitals shows.

This figure is an increase of 2,829,088, or 22.5 per

cent, over the previous year.

Births in hospitals during 1943 totaled 1,924,591. The number of hospitals increased by 310, while the number of hospital beds increased by 265,427 plus 5,686 more bassinets.

"This recent growth is the equivalent," states

the report in the A.M.A. Journal (March 25), "of a new 727-bed hospital for each day of the year.

The enormous expansion is due to wartime

needs.

The largest gain in number of hospitals occurred in the federal group, which would include Army, Navy, and Marine, or Public Health Service hospitals, and Veterans Administration Facilities. This group now numbers 827, as compared with 474 in 1942, and their bed capacity is given at 476,673, an increase of 255,735 since 1942.—Science News Letter, April 1, 1944

### Latin American Interns and Residents in U.S. Hospitals Not Counted in Quota

ATA RECENT meeting of the Directing Board of the Procurement and Assignment Service it was decided that graduates of Latin American medical schools currently serving as interns or residents would not be counted in hospital quotas.

It was felt that most Latin American doctors who accepted internships or residencies were in fact postgraduate fellows attached to U.S. hospitals. In some instances language difficulties precluded their rendering as much medical care to hospital patients as native born and U.S. trained house

officers. If Latin American physicians were to be counted in hospital quotas, there would be some hesitancy in accepting them in lieu of native-born United States medical graduates.

Since it is highly desirable to have Latin American physicians seek postgraduate medical training in the United States, dropping them from hospital quotas would encourage hospital superintendents to accept them as interns and residents and thus facilitate their securing additional training in this country.—J.A.M.A., March 11, 1944

### At the Helm

Three new members have been elected to the board of managers of the Presbyterian Hospital in New York City. They are Mrs. Frederic F. de Rham, of Tuxedo Park, and Frederick A. O. Schwarz and William J. Wardall, of New York City.\*

Dr. F. M. Miller, Jr., was re-elected president of the Medical and Surgical Care, Inc., a cooperative of the Hospital Plan, Inc., at the annual meeting of

the board of directors.

Re-elected to the board of directors of the Medical and Surgical Care, Inc., were: Walter F. Roberts, Lt. Cmdr. John F. Kelley, Dr. J. B. Lawler, Dr. Miller, Dr. Hyzer W. Jones, Albert C. Foster, Le-land D. McCormac, Dr. Robert C. Hall, Gilbert Butler, F. Ramsay Devereux, and Frank W. Mattinson, whose terms of office had expired.

Serving with Dr. Miller on the executive staff will be vice-presidents Dr. H. N. Squier and Lt. Cmdr. Kelley; treasurer Hall, and secretary Michael Yust,

all re-elected.\*

Dr. Stephen L. Walczak has been elected presi-

dent of the medical staff of Millard Fillmore Hospital in Buffalo, succeeding Dr. Harry C. Guess, president for the past three years, who declined re-election. Other new officers are Dr. Wendell P. Reed, vice-president, and Dr. Pierce Taylor, secretary-treasurer. They will serve with Dr. Guess, Dr. J. Curtis Hellreigel, and Dr. Herbert H. Bauckus, who were elected to the executive committee.\*

The election of Isidor Leviton, acting president of the Jewish Hospital of Brooklyn, as president was announced on April 2 at the hospital's forty-second annual meeting. He succeeds Capt. Alvin S. Rosenson, now serving in the Army, who was named a vice-president and director. Charles Jaffa was chosen for a seventh term as president of the hospital's Training School for Nurses.\*

Thomas S. McLane, president of the board of trustees of Roosevelt Hospital in New York City, has announced the election of Henry C. Brunie and Walter Hoving to the hospital board of trustees.\*

### **Newsy Notes**

Principals of a hundred and thirty high schools on Long Island received invitations for their students to attend the fifth semiannual Open House Week conducted by the Nursing Council for War Service on Long Island in twenty-three hospitals, Mrs. Dorothy D. McLaughlin, chairman of the council, announced.

Open House Week began March 28 and continued through April 1. Members of the current high school graduating classes, particularly, and students in other grades in the schools were invited to join

groups which made the tours of the hospitals.

Mrs. McLaughlin pointed out that Open House Week was adopted as a recruiting measure two years ago in February and had proved to be the most direct method of reaching high school graduates with a constructive plan by which they can become an immediate part of the war effort.

In addition to this drive to recruit high school graduates as student nurses, the Council is spon-

soring a series of refresher courses for retired graduate nurses to bring them back into active nursing.\*

Membership in the Rochester Hospital Service Plan, previously limited to groups, has been extended to individuals.

The extension was voted in response to "an increasing demand" from persons who cannot qualify on the group basis.\*

The planning committee of the Hospital Council of Greater New York will undertake, as its major project for the year, the preparation of a master plan for hospitals and related facilities, according to Edwin A. Salmon, chairman of the Council and also of the City Planning Commission. Dr. Haven Emerson is chairman of the committee.

The scope of the master plan, it was said, should "show (a) all existing hospitals and institutions for the care of the sick which shall have been determined to be satisfactorily located and provide adequate facilities and distribution of clinical services for the future communities to be served; (b) those existing hospitals and institutions which are satisfactorily located but require certain modifications and additions; (c) all proposed new facilities which shall be deemed to be desirable and which, in addition to existing facilities, shall make adequate provision for a comprehensive plan of hospitals, together with recommended locations of each, with sufficient detail of each facility to provide a complete understanding of the services to be contained therein; and (d) such hospitals as desire to be relocated, closed, or merged with other hospitals.'

The other members of the master-plan committee are Dr. J. J. Golub, vice-chairman; Dr. Edward M. Bernecker, Commissioner of Hospitals; 'the Rev. John J. Bingham, Dr. E. H. L. Corwin, David H. McAlpin Pyle, and Mr. Salmon, all of the planning committee, and Dr. Neva R. Deardorff, Dr. W. G. Nealley, and Arthur W. Jones.\*

Progress in military medicine and what it will mean to future hospital care of civilians was discussed at the second wartime symposium of the United Hospital Fund of New York, which was held on March 27. The program was conducted in cooperation with the Greater New York Hospital Association and the New York Academy of Medicine.

Mrs. Frank E. Adair, vice-president of the United Hospital Fund and general chairman of women's committees, presided at the afternoon program, which follows: "The Hospital and Rehabilitation," Dr. Dean Clark, Senior Surgeon (R), U.S. Public Health Service, Chief Medical Officer; "Social Service in Military Hospitals," Miss Ruth Emerson, Assistant Chief in Charge, Domestic Hospital Program, Military and Naval Welfare Service, American Red Cross; "Current Nursing Program," Dr. E. M. Bluestone, director, Montefiore Hospital for Chronic Diseases; "The Voluntary Hospital and Lay Participation," Mrs. Maurice T. Moore, National Chairman, State Committee

Services, U.S.O.

The program for the evening, with Arthur A. Ballantine, vice-president of the United Hospital Fund, presiding included: "Progress in Military Medicine—The Army," Major General Norman T. Kirk, Surgeon General, U.S. Army; "Progress in Military Medicine—The Navy," Capt. French R. Military Medicine—The Navy," Capt. French R. Moore, Medical Corps, U.S. Navy, (returned from duty with the Marines in the field); "Responsibility of Voluntary Hospitals and Their Medical Staffs in Distribution of Adequate Medical Service," Dr. John P. Bowler, Dean, Dartmouth Medical School, chairman, Committee on Medical Education and Hospitals, New Hampshire Medical Society, and Dr. Leslie K. Sycamore, chief, Department of Radiology, Mary Hitchcock Memorial Hospital, Hanover, New Hampshire, Chairman, Committee on Medical Economics, New Hamp-shire Medical Society; "Hospitals in the Next Decade," Dr. Clarence C. Little, managing director, American Society for the Control of Cancer, and director, Roscoe B. Jackson Memorial Laboratory.

### MENTAL HYGIENE DEPARTMENT MAKES APPOINTMENTS

Twelve major appointments within the State Department of Mental Hygiene have been announced by Dr. Frederick MacCurdy, commissioner.

They include: Dr. Newton J. T. Bigelow, assistant commissioner since September 1, 1943, as deputy commissioner; Paul O. Komora, assistant secretary since August 1, 1942, as administrative secretary; Robert P. Rickards, who has been in charge of the reorganized reimbursement work of the department as director of reimbursement and associate attorney; Dr. Arthur W. Pense, acting medical inspector of the department, as assistant commissioner in charge of inspection service; Dr. Joseph Lee Camp, assistant director at Letchworth Village, as acting medical inspector of the department; Dr. Benjamin Malzberg, assistant director of statistics since

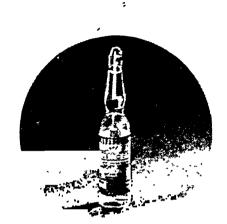

1928, as director of the bureau of statistics; Daniel J. Doran, formerly director of mental hygiene accounts, as business assistant to the commissioner; Leighton M. Arrowsmith, president of the hospital bureau of standards and supplies of New York City, as administrative advisor; Lester C. Elmendorf, former comptroller of the city of Kingston, as supervisor of purplesses. Fronk O. Osborn, formerly head acpurchase; Frank O. Osborn, formerly head account clerk, as chief account clerk; Dr. Alfred M. Stanley, former acting medical inspector of the department, as director of Harlem Valley State Hospital, Wingdale; Dr. John R. Ross, who left the state service in 1943 to serve as superintendent of the Rhode Island State Hospital, reinstated as director of the Hudson River State Hospital, Poughkeepsie.

### **EULOGY OF THE DOCTOR**

HERE are men and classes of men that stand above the common herd—the soldier, the sailor, the shepherd not infrequently, the artist rarely, rarelier still the clergyman, the physician almost as a rule. He is the flower of our civilization and when that stage of man is done with, only to be marvelled at in history he will be thought to have shared but little in the defects of the period and to have most notably exhibited the virtues of the race. Generosity he has, such as is possible only to those who practice an art and never to those who drive a trade: discretion, tested by a hundred secrets, tact, tried in a thousand embarrassments and what are most important, Herculean cheerfulness and courage. So it is that he brings air and cheer into the sick room and often enough, though not so often as he desires, brings healing.

### **ECONOMY IN THE OPERATING ROOM**

Worthwhile suggestions were made by Anna M. O'Neill, R.N., author of "Operating Room Technic", in a recent issue of Hospital Management, on how economies can be effected in the operating room.

These suggestions covered:

All the old gloves that are beyond repair are cut into circular bands 1/2 inch in width. The cuffs making the large size and the fingers making the small size, they make very good elastic bands now that rubber is scarce.

All the knife blades are sharpened each day. They can be used for ten or more operations before discarding.

All the needles bent or having the points blunted are straightened and sharpened.

Whenever it is practical and the consent of the surgeon has been obtained, a metal catheter is used instead of a rubber one; for example, in catheterizing a patient before operation as in the case of a hysterectomy.

Now that Three-in-One Oil is very scarce for instruments, it was found that it was being wasted by pouring it from the bottle. A rubber nipple discarded by the O. B. Department was put on the bottle so a little could be squeezed out at a time.

### BREAKING HABITS

In the Ladies' Home Journal, an article on habits brings out among many interesting disclosures on habits, this sage advice on breaking a habit:

"It is not wise to break any habit. Instead it should be displaced. In other words, form a new habit, don't try to strangle off the old one. Gum chewing, for instance, can be substituted for smoking. Many people have adopted the eating of hard candies to displace tobacco. An outstanding surgeon and congressman from New York State recently stopped smoking by merely not lighting his cigarettes. He carries one in his mouth, unlighted for a couple of hours at a time, and thus gets the mouth satisfaction without other effects.

"When smoking is stopped abruptly, the person is likely to indulge in a wave of extravagence, go on a shopping spree, start lip smacking, or nail biting, or become jittery in general. This is true of most habits people want to break; when 'broken', the habit breaks out in disguised form. There have been too many inspirational preachments to the effect that any habit can be broken if a person only has enough will power.

"Habits can be sidetracked or displaced by new ones, but seldom successfully suppressed. Don't ask yourself, 'Am I strong enough to break this habit?' Instead say, 'What can I do to take the place of it?'"

### IN WHOOPING COUGH

ELIXIR BROMAURATE IS A UNIQUE BEMEDY OF UNIQUE MERIT

Cuts short the period of the illness, relieves the distressing cough and gives the child rest and sleep. Also valuable in other PERSISTENT COUGHS and in BRONCHITIS and BRONCHIAL ASTHMA. In four-ounce original bottles. A teaspoonful every 3 or 4 hours.

### ANNOUNCEMENT

A NEW SERVICE . . .

In Hediger Hall, on the scenic Michell Farm grounds, we now have accommodations for a limited number of elderly ladies needing some supervision and medical care in a homelike atmosphere.

Information on request

### RIBOFLAVIN AND HIGH BLOOD PRESSURE

In a report to the American Chemical Society at its convention in Cleveland, Dr Gustav J Martin of the Warner Institute for Therapeutic Research revealed that tyrosine, an amino acid closely related to many chemical substances taking part in body maintenance, causes an increase in blood pressure when injected into patients suffering from hypertension.

Experiments with animals had previously shown that such results would be found. These experiments also demonstrated that a deficiency of riboflavin, one of the B complex factors, may be associated with the increase of blood pressure.

Tests indicated that an enzyme controls the utilization of tyrosine by the body and this enzyme contains the vitamin B<sub>2</sub> as part of its structure. A lack of riboflavin appears to cause excess amounts of the tyrosine to be discharged through the kidneys and, in passing through, effects that organ in such a way that the blood pressure increase results

### VITAMIN LONGEVITY

Not all vitamins can stand the test of time-a few not even a little-but some will survive for a long time

Barley grains from King Tut-ankh-amen's tomb were tested by the Ministry of Foods, Cereal Research Station at St Albans, England, and were found to contain riboflavin and nicotinic acid, in each case approximately a third the amount found in fresh barley.

These grains recovered from the tomb of the Egyptian king had been entombed for almost thirty-three centuries It is perhaps an error to describe vitamins as "surviving" as they are not living matter but merely chemical molecules, and as such are highly organized structures that can deteriorate under unfavorable conditions.

### OUT OF THIS WORLD

TABLE CLOTH IN 194?—Among the things to come is a table cloth made of aluminum. One company is producing aluminum yarn as a post-war Washable, it never dulls or tarnishes product can be dry-cleaned, and one pound of aluminum will make 11,000 vards of varn.

### CARBON DIOXIDE ATMOSPHERIC APPARATUS FOR SMALL LABORATORIES

Experiments conducted since early last spring by Staff Sergeant B. Branscombe, Picton, Ontario, a laboratory technician at Petawawa Military Hospital, have culminated in the design and a working model of an inexpensive carbon dioxide atmospheric apparatus used for culture work in small medical research centers.

Staff Sergeant Branscombe's effort in this field is not intended to replace the existing apparatus in use in large laboratories but is designed primarily for smaller labs not equipped with expensive apparatus. The working model described has been in satisfactory use at Petawawa Military Hospital for some time.

The standard method of creating an atmosphere of carbon dioxide, essential for the growth of some bacteria, is the mercury pressure gage—a glass jar with a ground glass top to make it airtight and an electric vacuum pump. Staff Sergeant Branscombe,

in describing the action of his apparatus, claims that his model will produce the same effect as expensive equipment. The carbon dioxide is forced by its cylinder pressure into the lower jar, which forces the fluid in the jar through a tube into an upper jar. The upper jar is graduated so that the quantity of carbon dioxide can be measured to the required amount. The fluid, finding its way back into the lower jar, forces the measured amount of carbon dioxide into the container containing the culture.

Staff Sergeant Branscombe was born in Picton, Ontario, and received his education at Picton Collegiate. In civilian life he was employed as a pharmacist's assistant. Enlisting in the R.C.A.M.C. in Kingston, Ontario, in March, 1940, he has served at Kingston, Barriefield, Richerson Laboratory at Kingston General and Toronto Central Laboratory, until coming to Petawawa Military Hospital in April of 1941.

The five most common causes of the deaths of school children in the United States are, in the order named, accidents, appendicitis, influenza and pneumonia, rheumatic fever, and tuberculosis.—Science News Letter

A recent survey showed that one out of every three drugstore customers now buys a vitamin product. "Obviously," comments a dispensing physician, "the other two merely eat there."—Medical Economics.

#### BIRTH CERTIFICATES

Many will remember the experience of obtaining a passport, as recounted by the late Will Rogers. Everything went well until he was asked for his birth certificate. After explaining the absence of such documents in his early years, he was requested to give the evidence of some witness that he had been born. Having a baby was a rather private affair in his family, was his reply, and no outsiders were allowed.

Lack of birth certificates may be the cause of jesting, but it may also be the source of much troubleand this was never truer than it is today. Birth certificates have become the sine qua non for securing

## BLOOD PLASMA AVAILABLE COST THROUGHOUT MICHIGAN

Broadening medicine's field of service to the people of the United States, the State of Michigan has put into effect a free blood plasma service for all physicians in the state, by which the vital plasma is now available to make all and the state. now available to medical men without regard to the

now available to medical men without regard to the patient's ability to pay for this lifesaving assistance. As described by C. C. Young, director of the Bureau of Laboratories for the Michigan Department of Health, the free plasma service ment of Health, the free plasma service problem which has bothered many medical men, problem which has bothered areas. Writing in the especially in sparsely settled areas. Writing in the March issue of Hospitals, the Journal of the American Hospital Association, he tells how the blood, procured from individual donors through locally sponsored donation clinics, is processed at the despectation. procured from individual donors through locally sponsored donation clinics, is processed at the department's Lansing laboratories and distributed for storage throughout the state against the day of its eventual necessaria.

The initial number of units of plasma credited to a participating community is determined by the donor response therein. The community is credited with the yield from its donors and debited a small amount reserved for OCD and state emergency use. Thereafter replacement schedules are maintained on the basis of receipts from physicians showing the amounts used.

BLOOD POWDER TO SPEED HEALING OF WOUNDS—Science, in a recent issue, reported that Drs. T. H. Seldon and H. H. Young of the Mayo Clinic have successfully used blood powder from red blood cells, salvaged from plasma production, in speeding wound healing.

# QUICK RELIEF from

IVY, OAK or SUMAC POISONING...

PACKAGE, 4 FL. 02.

# Lederle RHULITOL\*

A SOOTHING, HEALING SOLUTION

RHULITOL Lederle is a solution of tannic acid and glycerine, chlorobutanol, phenol, camphor, ammonium alum, isopropyl alcohol and distilled water. The protein coagulating properties of tannic acid apparently inactivate the toxic principle of these common plants and also prevent further spread of the dermatitis.

The solution should be applied as a wet dressing at intervals of several hours during the acute stage, reapplying at increasingly longer intervals as the dermatitis subsides.

Relieves pruritus, local pain and congestion

Exerts a drying and cooling effect

## WELLCOME' GLOBIN INSULIN WITH ZINC

The diabetic's insulin requirements are not static but change as the patient goes through the day. 'Wellcome' Globin Insulin with Zinc is timed to conform to the patient's needs, providing rapid onset of action at the start of the day, a continuing effect to meet the peak demands of afternoon and early evening, and a waning of action at night when requirements diminish. Because of this unique type of action, a single injection daily will control many moderately severe and severe cases of diabetes. Nocturnal insulin reactions are rarely encountered. Globin Insulin is comparable to regular insulin in its freedom from allergenic skin reactions. Wellcome' Globin Insulin with Zinc, an important advance in diabetic control, was developed in the Wellcome Research Laboratories, Tuckahoe, New York. U. S. Pat. No. 2,161,198.

# Carnacton of Clinical Value

In ANGINA PECTORIS • ARTERIOSCLEROSIS • PERIPHERAL VASCULAR DISEASES

Carnacton is a biologically tested extract of highly vascularized and active diaphragmatic muscle with a high metabolic rate... providing dependable vasodilator and depressor benefits. Carnacton helps establish collateral circulation and promotes cardiovascular tone and vitality.

Ampuls of 1 cc. and 2 cc.—boxes of 12 and 50; vials of 30 cc. for oral use. For detailed brochure address Dept. N.

CAVENDISH PHARMACEUTICAL CORP. , 25 West Broadway , New York

#### OWNED AND OPERATED BY

#### THE STATE OF NEW YORK

# If 70,000 physicians leave civilian practice

... the load doubles, triples for you practitioners who remain. Particularly are you entitled to aid with your chronic heart, circulatory and rheumatic cases where the responsibility of continuous direction is most taxing on your energy and time.

Saratoga Spa was planned for your use in your care of such patients, and for those suffering from obesity, general debility and stomach disorders. Nature localized here a store of naturally carbonated mineral waters of established therapeutic value. New York State, safeguarding these waters, has organized around them, ideal facilities for your use. Here patients reorder their lives in accordance with your direction, and prepare themselves for the full benefit of your advice.

The non-practicing Medical Staff of the Spa simply oversees the treatments you prescribe. Local specialists are available for your choice, should you feel your patients need medical supervision, while they are here.

For professional publications of The Spa, physician's sample carton of the bottled waters, with their analyses, please write W. S. McClellan, M. D., Medical Director, Saratoga Spa, 155 Saratoga Sp ings, N. Y.

THE EMPIRE STATE'S CONTRIBUTION TO THE MEDICAL PROFESSION

... in the best interest of your patients

## Because we realize

that the best interests of patients require that they receive advice on matters pertaining to health from qualified physicians only, we confine all advertising on our gynecological products to physicians and the druggists who serve them.

OMO SHICAGO JUNE 12:16, 1944 Careful consideration of all the features of the "RAMSES"\* Flexible Cushioned Diaphragm will, we believe, satisfy the physician that the interests of the patient are served best when "RAMSES" Diaphragms are specified.

\*The word "RAMSES" is the registered trademark of Julius Schmid, Inc.

Velvet smooth pure gum rubber dome, Patented Flexible Cushioned Rim.

Gynecological Division
JULIUS SCHMID, INC.

Established 1883

423 West 55 St.

New York 19, N.Y.

N THE treatment of iron deficiency anemias, numerous clinical and biochemical studies have established that utilization of iron is most satisfactory when copper is present as catalyst.

# ARL-CU-FER

HEMATINIC IN IHON DEFICIENCY ANEMIA

ARL-CU-FER combines iron (in the form of pyrophosphate) and copper in the ratio of 20:1.

# PRO-CU-FER\*

HEMATINIC IN IRON DEFICIENCY ANEMIA

PRO-CU-FER retains this same optimal iron copper ratio but with the iron chemically combined with protein.

Both preparations are supplied in bottles containing 60 tablets. Dosage recommended for adults and children: Four tablets daily, immediately after meals.

ARL-CU-FER and PRO-CU-FER tablets are pleasant-tasting and non-staining. They may be chewed, swallowed whole, or allowed to dissolve on the tongue. These preparations are manufactured under license from The Wisconsin Alumni Research Foundation—Hart patent No. 1,877,237.

## MUCUS SOLVENT

That's important in treating mucous membranes of the nose.

# Throat Chemotherapy without Systemic Toxicity

White's Sulfathiazole Gum provides a high and very prolonged salivary concentration of locally active sulfathiazole throughout the whole oropharyngeal area—with almost negligible elevation of the blood level.

One tablet, chewed for onehalf to one hour, promptly initiates a high salivary concentration of dissolved sulfathiazole—and maintains throughout a full hour's chewing period, an average concentration of 70 mg. per cent.

Yet even with maximal dosage, and even in children, resultant blood levels are not even

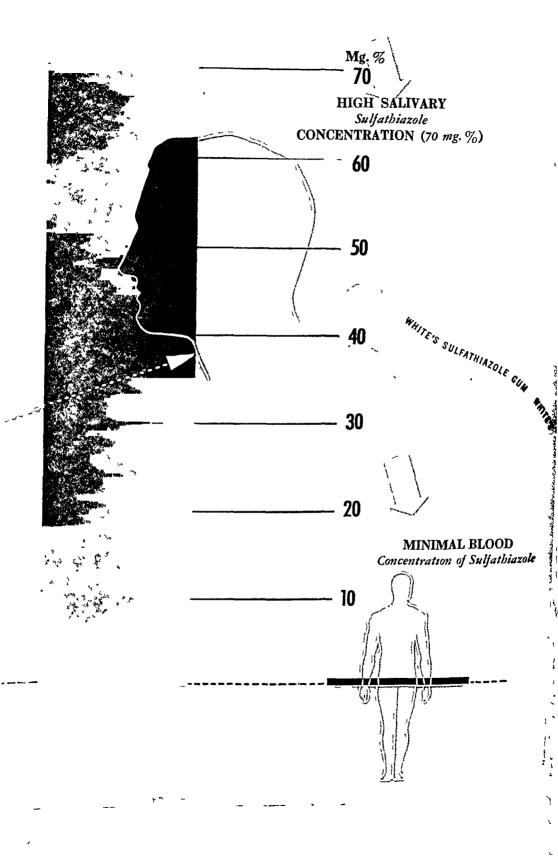

\*ULATHIAZOLE GUM

quantitatively measurable for the most part and at no time exceed 1 mg. per cent. Freedom from the likelihood of systemic toxicity is obvious.

Valuable in the treatment of such conditions as septic sore throat, peritonsillitis, pharyngitis, tonsillitis, infectious gingivitis. Widely prescribed—ethically promoted, of course.

White's Sulfathiazole Gum is supplied in packages of 24 sanitaped tablets, in slip-sleeve prescription boxes—on prescription only. White Laboratories, Inc., Pharmaceutical Manufacturers, Newark 7, N. J.

Remember the days when people laughed at the "gas buggy"...how they would sing out "get a horse" when the horseless carriage rode by? A rarity once, it's an accepted necessity today.

There were days, too, when people avoided MARGARINE. But that was yester-day. MARGARINE's present uniform vitamin A fortification, its nutritious American fats which provide the important unsaturated

fatty acids, plus its increased palatability, sweetness, freshness and...ease of digestibility...have made it an outstanding nutritious spread and cooking fat.

Prejudice against MARGARINE is as ridiculous as would be a prejudice against the modern automobile, for this energy-producing food is part of the seven basic food groups which authorities state are needed for good nutrition.

## NATIONAL ASSOCIATION OF MARGARINE MANUFACTURERS MUNSEY BUILDING WASHINGTON, D. C.

I pound of MARGARINE provides wholesome, easily digested vegetable oils and meat fats of American origin together with a minimum of 9,000 I U of vitamin A. Each batch undergoes an average of ten tests for purity and stability

INTRAVENOUS ANESTHESIA

Intravenous anesthesia has been employed in a variety of ways depending upon the clinical requirements:

- As the sole anestheric for operations and surgical procedures of short duration.
- 2 As a method of induction for inhalarion anesthesia.
- 3 In combination with local, regional or spinal anesthesia.
- As a supplement when an operation is prolonged beyond the duration of the full effect of local, regional or spinal anesthesia.

EVIPAL SOLUBLE IS SUPPLIED IN AMPULS OF 0.5 GM. AND 1 GM.

Brand of HEXOBARBITAL SOLUBLE (Sodium salt of N methylcyclohexenylmethyl barbitum acid)

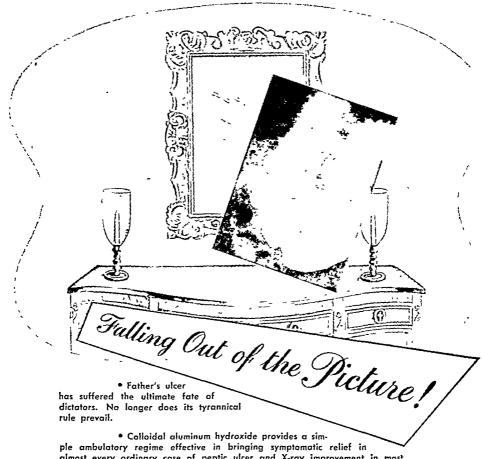

Evipal Soluble has characteristics which make it highly useful for inducing these various types of anesthesia of short duration. Proper dosage gives deep relaxation of voluntary muscles, yet quick awakening and recovery, generally after twenty or thirty minutes.

# For the infant deprived of mother's milk

# SIMILAC SIMILAR TO BREAST MILK

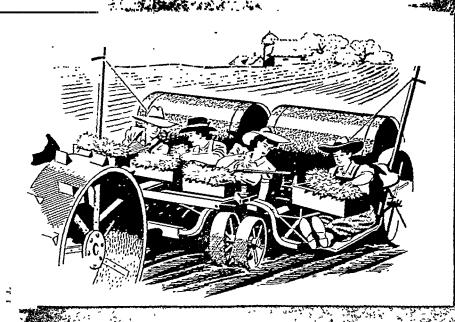

A powdered, modified milk product especially prepared for infant feeding, made from tuberculin tested cow's milk (casein modified) from which part of the butterfat is removed and to which has been added lactose, olive oil, coconut oil, corn oil, and fish liver oil concentrate.

Similac provides breast milk proportions of fat, protein, carbohydrate and minerals, in forms that are physically and metabolically suited to the infant's requirements. Similac dependably nourishes—from birth until weaning.

One level tablespoon of Similac powder added to two ounces of water makes two fluid ounces of Similac. This is the normal mixture and the caloric value is approximately 20 calories per fluid ounce.

M & R DIETETIC LABORATORIES, INC. - COLUMBUS 16, OHIO

# PLENTY OF ACTION IN THE TOMATO FRONT

● Ever see a tomato planting machine in action? That is one pictured above—in a Kemp's Sun-Rayed field. Many of these tractor-drawn machines are manned by women and children who drop the pedigreed seedlings at mechanically timed intervals into furrows which the machine makes, waters, covers. In north central Indiana, where the world's finest tomatoes are grown, we shall pack millions of cans of Kemp's Sun-Rayed brand Tomato Juice to help meet war-time needs. All of it will be made, of course, by themp's patented process which insures high retention of vitamins A, B₁ and C.

NON-SEPARATING

#### THE DAWN

### OF HOPE

## for today's CARDIOVASCULAR PATIS

As the result of recent studies, 1 2,3 a more optimistic prognosis now prevails for patients suffering with cardiovascular disease The modern classification of such pathology as an acute or subscute condition — rather than as a chronic one-establishes the attainable objective of symptomatic relief, with avoidance of undesirable side reactions

This is capably accomplished, in many cases, with Calpurate -a chemical combination of calcium theobromine and calcium gluconate which . . .

Eases venous congestion through vasodilating and divretic action, and

Increases cardiac output through myocardial stimulation

Of clinical importance because Calpurate has the advantage of being almost insoluble in the stomach, yet readily absorbable by the intestine, it is remarkably free from gastric irritation 4

Calpurate is especially indicated in angina pectoris, cardiac edema, coronary sclerosis, Cheyne-Stokes respiration, and paroxysmai dyspnea.

Dosage. 1 or 2 tablets, or 7 to 15 gr. powder

Packaged. As tablets (each containing 712 gr. calcium theobromine - calcium gluconate), in bottles of 100, 500 or 1,000-or as powder in 1 oz. bottles

Also available, with 14 gr. phenobarbital added per tablet.

## CALPURAT

THE MALTBIE CHEMICAL COMPANY . NEWARK, N.J.

# THE BEST B COMPLEX

—and **BEZON**\* comes from Nature. It is concentrated from primary yeast, corn, wheat—natural sources from which come the whole Natural B Complex.

Because B deficiencies are almost always multiple, authorities stress the importance of the *Whole* B Complex—certain factors of which cannot be synthesized.

**BEZON** contains no synthetic vitamin factors—it is Whole

Natural Vitamin B Complex, concentrated to high potency from natural sources.

BEZON is a Whole Natural B Complex which contains one milligram of natural thiamine, two milligrams of natural riboflavin, together with all the remaining members of the B Complex, concentrated in two tabules.

Supplied in bottles of 60 and 200 tabules.

Samples and literature available on request.

#### What Others Think, IV

From the Bulletin of the Council on Medical Service and Public Relations of the A.M.A., under date of March 25, 1944, we excerpt the following:

The American Bar Association has released the report of its special committee to study the portions of the Wagner-Murray bill relating to Federal control and regulation of medical practice and hospitalization. This report considers in detail the provisions and implications of S. 1161, and fills thirty-five double-spaced typewritten pages.

The following summary has been taken from the

last two pages of the report:

The American Bar Association is limited to an expression of opinion and judgment with respect to those fields which relate to the administration of justice and which directly affect the safeguards and protection of the rights and liberties of the citizens of this country. Under normal circumstances, therefore, it is not the function of this Association to attempt to influence substantive legislation by the Congress of the United States. But when under the pretext of the general welfare legislation is proposed in Congress which either inadvertently or with deliberate subtlety constitutes a direct attack on the rights and liberties of the citizens of this country, it becomes the duty of this Association actively to voice its objections, a summary of which is as follows:

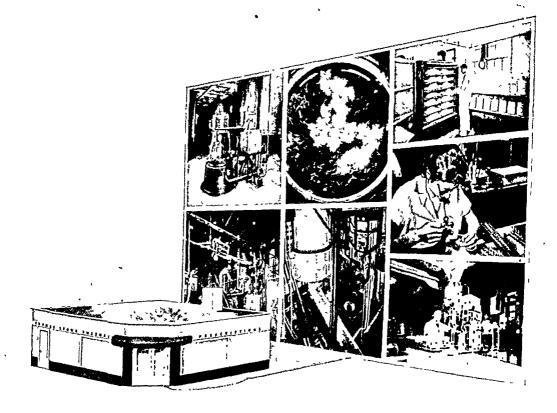

- 1. Local self-government must be preserved in our Federal system. State governments directly responsible to the will of the people are best adapted to exercise such supervisory control as may be instituted over the health and medical care of our citizens.
- 2. S. 1161 seeks to invest in the Surgeon General, who is not an elected servant of the people and who is not amenable to their will, the power arbitrarily to make rules and regulations having the force and effect of law which directly affect every home.
- The measure furnishes the instrumentality by which physicians for their practice, hospitals for their continued existence, and citizens

for their health and that of their families can be made to serve the purposes of a Federal agency.

- 4. The bill fails to safeguard the rights of patients, citizens, hospitals, or doctors with respect to disputes arising or rights denied through the arbitrary or capricious action of one man.
- The bill fails to provide for any appeal to any court from the action of the Surgeon General.
- 6. The vicious system whereby administrative officials judge without court review the actions of their subordinates in carrying out orders issued to them is extended in this bill to a point foreign to our system of government and incompatible with the adequate protection of the liberties of the people.

The Constitution of the United States is designed to protect the citizens of this republic in the exercise of the rights of free men. The provisions of that instrument can be rendered impotent, when our citizens, for the sake of an apparent immediate benefit, surrender to their government such direct control over their lives that government, by imposing a constant fear upon them of having those benefits withheld or withdrawn, can compel from them obedience and subservience to its dictates.

The objections of the American Bar Association to the provisions and implications of S. 1161 seem to us well founded, and we hope that our membership will seriously study them and pass them along to other taxpaying citizens. The objections are clearly stated and will be comprehended by all physicians, whether they agree with them or not. Erosion of the constitutional safeguards of the rights of the individual has proceeded far enough; surrender to government of direct control over the lives of the citizens has progressed dangerously. But

# Thomas Brown, Ph.G.

In common with thousands of other pharmacists throughout the nation, Thomas Brown endeavors, at all times, to render a competent professional service. Physicians tributary to his store know that so far as medication is concerned their responsibility ends with the writing of the prescription. They can safely leave the rest to Pharmacist Brown.

Although Mr. Brown's first responsibility is compounding prescriptions, he also performs small-scale manufacturing. Many preparations can be made advantageously in his own laboratory.

For others, however, he must depend on the large manufacturers. In this classification are the barbiturates which require a wide range of equipment for production and control.

Eli Lilly and Company has been prominent in the study of the barbiturates and is responsible for 'Amytal' (Iso-amyl Ethyl Barbituric Acid, Lilly), 'Sodium Amytal' (Sodium Iso-amyl Ethyl Barbiturate, Lilly), and 'Seconal Sodium' (Sodium Propyl-methyl-carbinyl Allyl Barbiturate, Lilly), each a leader in its field.

#### PROGRAM OR GUINEA PIG

Previous comment has been made on this page concerning the minutes of the conference on the Emergency Maternal and Infant Care Program as published in the Journal of the American Medical Association for December 25, 1943.

Miss Lenroot is quoted in these minutes (which we understand were prepared by the Children's Bureau) as stating that the Emergency Maternal and Infant Care Program "has never been presented to Congress, the Bureau of the Budget, or to anyone else by the officials of the Children's Bureau, as anything but an emergency program, 'emergency' meaning the usual definition of the war period and six months following the termination of the war."

Further on Miss Lenroot apparently reiterated this opinion in stating that she wanted "to make it clear-that this Emergency Maternity and Infant Care Program was developed in response to need and was in no way a part of any master plan or strategy."

Dr. Martha M. Eliot, associate chief of the Children's Bureau, apparently has other views. In the June, 1943, issue of Briefs, published by the Maternity Center Association of New York City, Dr. Eliot contributed an article entitled, "Design for

Tomorrow's Maternity Care."

There she is quoted: "There would seem to be little reason why decisions should not be reached now as to the general framework and many of the details of a plan for public maternity care and medical care of children to be put into effect after the war. At best, it will take ten years to develop the program in all its parts."

Is the E.M.I.C. program a guinea pig experiment?

No one is any longer to be cajoled by the promise that most of these programs are of an "emergency" nature.

"The story of the exchange of liberty for order, stability, and security under Fascism is the story not alone of wicked men, grasping for power and then abusing it. Far more tragically, it is the record of good men, gulled into thinking that measures distasteful in form were none the less tolerable because they were to be carried on for good ends."1

We have had sufficient warning in the texts of much current and some proposed legislation of a kind of thinking which, under pretext of the promotion of the general welfare, "either inadvertently or with deliberate subtlety constitutes a direct attack on the rights and liberties of the citizens of this country." We either heed that warning or we do not. Coming from the American Bar Association, the monition carries a weight of authority that cannot be disregarded.

#### Peptic Ulcer—A Constitutional Disease

Modern medicine is composed of synthetic and hyphenated elements. This is exemplified by the use of such terms as "psychosomatic diseases" and other kindred titles which signify the interrelationship of the mind and body, and other systems or organs in the evolution of disease. In this modern category peptic ulcer has now been assigned a corner, a distinct advance from the time when there prevailed the concept of this disease as a purely localized one, and it was treated accordingly.

Recent surveys of peptic ulcer reveal many factors involved in its pathogenesis.1 The role of heredity and environment has been summarized in the sentence "Peptic ulcer is a case of selective environment acting on favorable constitutional terrain."2 It is a disease of the young, four to five times more frequent in the male, occurring more commonly in the energetic races-in the white race rather than in the Negro or the yellow race. The "drive of civilization" may be the reason for the greater susceptibility of white people. It is curious that treatment is more resistant and protracted in the spring. It may also be significant that a high percentage of ulcers are multiple.

The psychic and neurogenic elements have been forcefully emphasized by nearly all recent students of this question. In peptic ulcer neurosomatic and psychosomatic factors play a major causative role.3 Hyperchlorhydria, hypertonus, and hyperperistalsis can all be produced by stimulation of the vegetative nervous system or its diencephalic center. Disharmony, motor instability, and unusual reactivity can also be caused by parasympathetic reactions. The psychologic panel reveals constant nervous and mental strain, fluctuating emotional capacities, rapid exhaustion of nervous and emotional energy, and overactive psychomotor activity.

Such studies diverge widely from the narrow and now outworn concept of peptic ulcer as a disease of the stomach or duodenum. The modern view is that peptic ulcer is a local manifestation of a systemic state; a local secondary phenomenon secondary to constitutional predisposition. The disease is induced by neurosomatic elements of a constitutionally predisposed nervous and emotional system along inherited, grooved pathways. The modern physician must hence treat the patient with a peptic ulcer, not simply the peptic ulcer.

there are signs that the people are ready to protest.

The National Physicians' Committee for the Extension of Medical Service has released the findings of the survey conducted by the Opinion Research Corporation of Princeton, New Jersey. This report shows that only 16 per cent of the American people approve the Wagner-Murray-Dingell bill to regiment the medical profession with the 6 per cent social security tax for employer and employee.

Other findings of this report are given in a news item, published in the Chicago Daily News, March 8, 1944:

The twenty-nine questions asked in the survey brought such answers as these:

Fifty-six per cent insist on personal choice of a physician; 79 per cent have their own doctor, and 81 per cent feel that the doctor takes a personal interest in them.

Seventy-seven per cent believe that their doctor's charges have been reasonable and satisfactory, but 29 per cent said they had put off going to a doctor because of prospective costs.

Sixteen per cent would be willing to pay from \$2.00 to \$6.00 a month to guarantee themselves full health care.

The survey also showed that more than 22 per cent of American workers already are protected by health payment plans.

At the same time less than one in ten persons interviewed regarded the American Medical Association as a "trust" or a "union."

Concluding the report, the committee called on the medical, hospital, nursing, and other related professions, the insurance companies, organized labor, business, and industry to act together to solve a problem that is "not exclusively a medical responsibility."

On the president's page of the February, 1944, number of the Michigan State Medical Society *Journal* appears the following, which is signed by Dr. C. R. Keyport, and which we reprint in part:

#### FREE ENTERPRISE IN MEDICINE

Permit me to quote a few statements made in the House of Representatives, December 7, 1943, by the Honorable A. L. Miller of Nebraska:

"The practice of medicine under the free institutions of this country of ours has advanced the healing art until it is the envy of the whole world. In the short space of one hundred and fifty years it has so improved the health of this nation that the life expectancy has been nearly doubled. Where it was thirty-five years, it is now sixtythree years. New technics for treating disease have been developed and new drugs have been discovered. The sulfa drugs and penicillin are just the latest examples. Free men with great minds have founded medical schools and colleges and established laboratories for research. There has been a ceaseless probing and searching of the unknown for the purpose of curing disease. Many of the terrible diseases of the past have been rendered almost harmless. Today, twice as many of our wounded now recover as in the last World War....

"During the past year, we have seen how one Bureau (U.S. Children's Bureau) through its bureaucratic thinking and its directives has whipped into line the medical profession in every state with but one or two exceptions. This is just a small entering wedge. Are you doing your part to prevent a repetition of this on a larger scale? Are you fighting to keep free enterprise in Medicine—and to keep out a complete medical bureaucracy?"

Where is Federal infiltration to stop? He who has the purse calls the tune. As the Citizens' National Committee¹ states: "In the fiscal year 1942, the United States government made payments to the States, of the type known as grants-in-aid, totaling \$693,900,000. Other Federal payments within, but not directly to, the States, resembling grants in various ways and known as quasi grants, amounted to \$2,462,900,000.....

Not until very recent times did Federal subsidies by-pass the state government or exercise a leverage upon that government to levy taxes and make appropriations which in its sole and individual judgment it would not have done. It reveals that the process first of inducing states and then of coercing states has many stages between persuasiveness and compulsion and that what starts as humanitarian reform may end as a centralized bureaucracy.....

Prior to the great depression, Federal payments to the states never reached an annual total of \$200,000,000. Thereafter they spurted. The following figures reveal the increase of grants-in-aid, from a figure of less than \$6,000,000 in 1912.

Year	Millions
1917	13.6
1922	
1927	134.1
1932	264.7
1937	393.7
1942	693.9

These figures show a significant and unmistakable trend. A trend toward the increasing control of state and local policy by financial dictate by the Federal government. An example of this is the method employed by the Children's Bureau in setting up the E.M.I.C. program.

The following is taken from the editorial page of the Wisconsin Medical Journal, March, 1944:

#### PROGRAM OR GUINEA PIG

Previous comment has been made on this page concerning the minutes of the conference on the Emergency Maternal and Infant Care Program as published in the *Journal of the American Medical Association* for December 25, 1943.

Miss Lenroot is quoted in these minutes (which we understand were prepared by the Children's Bureau) as stating that the Emergency Maternal and Infant Care Program "has never been presented to Congress, the Bureau of the Budget, or to anyone else by the officials of the Children's Bureau, as anything but an emergency program, 'emergency' meaning the usual definition of the war period and six months following the termination of the war."

Further on Miss Lenroot apparently reiterated this opinion in stating that she wanted "to make it clear-that this Emergency Maternity and Infant Care Program was developed in response to need and was in no way a part of any master plan or strategy."

Dr. Martha M. Eliot, associate chief of the Children's Bureau, apparently has other views. In the June, 1943, issue of *Briefs*, published by the Maternity Center Association of New York City, Dr. Eliot contributed an article entitled, "Design for Tomorrow's Maternity Care."

There she is quoted: "There would seem to be little reason why decisions should not be reached now as to the general framework and many of the details of a plan for public maternity care and medical care of children to be put into effect after the

war. At best, it will take ten years to develop the program in all its parts."

# Herbert H. Bauckus, M.D.

Dr. Herbert H. Bauckus was born in Town Line, New York, on March 24, 1892. He was graduated from the University of Buffalo in 1914 and has practiced in Buffalo as a dermatologist since that time. He served as chairman of the Buffalo Board of Health from 1938 td 1941.

Dr. Bauckus has been president of the Erie County Medical Society, chairman of the Committee on Public Relations and Economics of the Medical Society of the State of New York, as well as chairman of the Subcommittee on Voluntary Nonprofit Medical Expense and Indemnity Insurance. He was also chairman of the Subcommittee for the Study of Industrial Health and a member of the Joint Committee on Dental Health of the State Medical Society and the State Dental Society. He was also a member of the Planning Committee for Medical Policies of the Medical Society of the State of New York.

In 1943 he became President-Elect of the Medical Society of the State of New York.

# Laws or Men?

The recent seizure by the government of the Montgomery Ward Company, a concern which to the ordinary mind is not one producing munitions or war material of any kind, seems indicative of the attitude of government toward private enterprise in general. In that a certain portion of the institution of medicine still remains "private enterprise" it is directly concerned in this case, and in its outcome. As Mark Sullivan says:

Much depends on whether the people—the average man and every man—can be made to see how far and deep the Ward case goes. To do this calls for re-education of our people in principles of government and law and individual rights—principles so long taken for granted that the average person has come to think of them as a part of the permanence of nature, like the weather and the rotation of the seasons. A new generation of Americans must learn that these principles had to be established by struggle and now must be defended by vigilance.

True, these principles are modified by war, but the modifications justified by war are as definite as the principles themselves. The modifications, like the principles, are set down in the Constitution, in laws written by Congress and in judicial decisions and precedents.

Further, the Ward case cannot be looked upon as an event standing alone, as if it took place in the vacuum of war. Everyone knows that the tendency toward what the Ward case involves—increased power of government to regulate the citizen, to put compulsion upon him—began before the war. The tendency has gone on for more than ten years. . . . . And it is in the light of this broad tendency that the Ward case must be judged. 1

1 New York Herald Tribune, May 1, 1944, page 15.

While it is true that there is not yet any question of contract between medicine as "private enterprise" and labor organizations with maintenance of union membership, dues check-off, seniority rights, grievance machinery, and arbitration of disputes, who is to say that it is not to come?

Already, for example, medical schools, hospitals, clinics, schools public and private, not to mention industrial plants where medicine is practiced as "free enterprise," are points at which, as part of the concern, the medical profession, since it works there, is subject now to such seizure as is illustrated by the Montgomery Ward case, with the Army blocking entrances and exits.

Add this to such proposed legislation as the Wagner-Murray-Dingell bill with its arbitrary dictatorship of the Surgeon General of the U. S. Public Health Service and you have something really serious to think about. Add also government control by subsidy, grants-in-aid, and arbitrary regulation such as that exercised by the Children's Bureau of the Federal Department of Labor and you have something even more serious to consider.

Expanded hospitalization seems also to be inevitable. Veterans and their families must, of course, have fuller hospital and health service, some forty millions of them, in all likelihood. Will medicine as "private enterprise" staff these hospitals in the next twenty years? What do you think?

Dr. Peter Irving

NEW YORK STATE JOURNAL OF MEDICINE

My Dear Dr. Irving:

The National Naval Medical Center, of Bethesda, Maryland, is endeavoring to collect for its archives a complete set of commissions issued to naval medical officers, and signed by past Presidents of the United States.

There is a small nidus now at the Center and it is hoped to be able to build this up to completion. Through the Navy Department Library and the National Archives a few more have been located. I am wondering whether you would care to insert a small item in your JOURNAL to this effect, with the idea that various libraries or individuals may have

in their possession such old commissions and would be willing to turn them over to the Center. If such are found and the owners are so generous, there could be no more fitting enshrinement to them than their use for this purpose.

Any assistance that you and the JOURNAL can extend will be greatly appreciated by the Surgeon

With best regards.

Sincerely yours,
ROBERT C. RANSDELL

# THE EARLY DIAGNOSIS AND EARLY TREATMENT OF CONGENITAL DISLOCATION OF THE HIP

FREDERICK R. THOMPSON, M.D., Sc.D. (MED.), New York City

IN CONSIDERING the early diagnosis of a congenital subluxation of the hip, it is necessary to remember that there are characteristic roentgenologic features which occur before the hip is actually dislocated. The name "dislocation of the hip" is a name applied to the condition when the head of the femur is out of the acetabulum. A more accurate nomenclature of the true basic condition is an "acetabular dysplasia." Actual dislocation of the head of the femur out of the acetabular socket is a secondary mechanical accident which is the result of this primary dysplasia. The primary dysplasia takes the form of a shallow acetabular socket which can be seen in the roentgenograms of the child from the time of birth and every week there-

The diagnosis is not difficult and is made easily after one is familiar with, and is quite certain of, the shape of the normal acetabulum in normal infants.

The cause of congenital dislocation of the hips lies definitely in a hereditary factor which is transmitted through either side of the family. This hereditary factor is a primary dysplasia or underdevelopment of the acetabular socket. The acetabulum instead of having a normal deep socket is shallow and oblique. Normal function of the hip in the presence of this faulty mechanics could permit the femoral head to dislocate in utero, at birth, or at any time subsequent to birth. Many of these acetabulae are not oblique enough to allow frank dislocation ever to take place. Although dislocation may not take place, the hip is still an abnormal hip and frequently causes persistent trouble and symptoms. It is important to remember this fact of dysplasia because there is much evidence to show that the socket can be made to develop properly if the hip is treated early. The sooner these measures are instituted, the quicker and the better is the acetabulum made to assume its normal shape. The early treatment is important from a second standpoint because the improper function of a shallow acetabulum seems to allow the head of the femur also to develop improperly. Many of the failures in the treatment of congenital dislocation of the hip, this author believes, are due to the fact that the secondary maldevelopment of the head has been

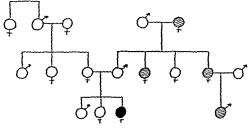

Read at the Annual Meeting of the Medical Society of the State of New York, Buffalo, May 5, 1943. From the Orthopaedic Service of St. Luke's Hospital, New York City

allowed to progress so long that it cannot reshape the primary acetabular defect.

#### Causation

The etiology of primary hip dysplasia has been studied very thoroughly by Faber. He has made unique studies of roentgenograms of families in which dislocation of the hip has occurred (Fig. 1). The roentgenographic consanguinity studies through several generations show that every gradation of an acetabular dysplasia may be present from a slight obliquity to one that is so oblique that the hip will dislocate. There seems to be a general rule that dislocation occurs more frequently in the female than in the male. The actual incidence of this frequency that is seen clinically is six females to one male. It is believed that the reason for this is that in the female the innominate bone is normally more nearly perpendicular than it is in the male. If a pelvic obliquity exists, this obliquity is closer to the perpendicular in the female than in the male, and the mechanics of normal function will allow the hip to dislocate. This proportion of six to one is seen to be materially lessened when one studies the roentgenograms which show only the dysplasia of the acetabulum in which no dislocation has occurred. Then the sex ratio between males and females is practically the same. In other words, in hereditary studies of roentgenograms of families with congenital dislocation of the hip there are

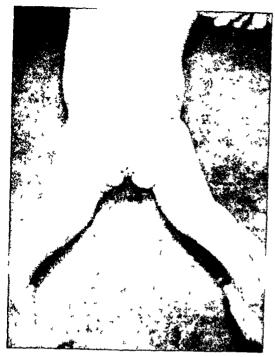

CONSANGUINITY ROENTGENOGRAPHIC

O = Normal Hips.

= Dysplasia without dislocation.
 = Dysplasia with dislocation.

Fig. 1. (Modified after Faber). The dysplasia gene is dominant and is transmitted through either side of the family.

Fig 3 A 13-month-old child who had an open reduction of dislocated left hip seven months before this picture was taken. Right hip is slightly dysplastic. Notice that the difference in thigh folds is still present.

just as many abnormally developed acetabulae in the males as in the females.

Hart2 has brought Faber's work to the attention of the American literature and has elaborated on this hereditary factor. He points out that Faber demonstrated that dysplasia of the hip joint without dislocation was three times as frequent as was the classical hip dislocation. In a total of 98 cases of primary hip dysplasia, 25 were actually dislocated and 73 were without dislocation. The dysplasia is consequently four times more frequent than had been supposed. There does not seem to be a sev linkage in the hereditary pattern. The gene is transmitted through the mother as well as through the father. It may be transmitted from father to son, but there is rarely any evidence that it is confined to the male or the female side of the family. The gene is dominant, and for this reason the faulty acetabulum should be seen in roentgenograms of the parent's pelvis. For this reason, too, the parents of children with dislocated hips should be roentgenographed to see if they have a dysplastic acetabulum, and measures should be taken to anticipate the symptoms that they subsequently may develop. All children of parents with dislocated hips or children with a

hereditary history of dislocated hips in the family should be roentgenographed at birth. It is only fair to advise parents of this tendency to dysplasia when they anticipate having children. Preiser<sup>3</sup> and Wiberg<sup>4</sup> have shown that parents with this latent dysplasia of the acetabulum develop a rather severe osteoarthritis of the hip joint.

In many cases in which a true dislocation exists in one hip, a dysplasia of the acetabulum may be seen on the opposite side. This fact is occasionally overlooked and only may be brought to the physician's attention when the so-called normal hip develops symptoms. For this reason, it is important to have a thorough knowledge of the shape of a normal acetabulum in a newborn infant.

# Early Diagnosis

From a practical standpoint it is not feasible to roentgenograph the hips of every newborn child. This would entail considerable expense for the parent and make an unnecessary increase in the cost of medical care. Many people object to having their children roentgenographed unless it is absolutely necessary. With this practical obstacle in view, it is therefore neces-

sary to resort to clinical means to arouse one's suspicion enough to demand a roentgenogram. If the hip is frankly dislocated, the diagnosis is self-evident. The child does not move the affected leg normally. There is a definite asymmetry of the contour of the body. The gluteal fold is high, and examination will reveal that the hip telescopes as the femoral head moves past the acetabulum. In the cases in which the hip is not dislocated but a shallow acetabulum exists, the diagnosis is more difficult. One must remember that a dysplasia of the acetabulum occurs three times more frequently than an actual dislocation. These children often show a definite difference in the creases of the thigh and of the gluteal fold. It is true that many normal children also possess these differences in the thigh folds. As one eminent pediatrician has told me, he has roentgenographed many babies because of this asymmetry in thigh folds but has not as yet found a definitely abnormal hip. This is a very practical objection, but it is difficult to see how one could notice the asymmetric folds and still not take the roentgenograms to make sure that no dysplasia exists. In all of the very early cases which the author has seen, where a dysplasia actually was present, there has been a definite asymmetry in the thigh folds. This asymmetry varies a little depending upon whether or not the child lies straight on his stomach with his legs in a straight line with the body. When it is seen, however, the assymmetry is very definite. Minor changes in the creases are more apt to be due to differences in the alignment of the body as the child is lying on his stomach. Whenever a gross difference occurs, we have noticed that the roentgenogram shows a dysplastic acetabulum (Fig. 2). It is difficult to explain the presence of this asymmetry when the hip is merely dysplastic and is not actually dislocated. The asymmetry is merely a fold in the rather thick fat that covers the thigh. One can readily understand how a hip that is dislocated and which has telescoped and shortened would cause a difference in the folds. When no dislocation has occurred, however, it does not seem reasonable that the folds should be present. It has nevertheless been our experience that they are present. They remain present in actual dislocations that have been reduced either by closed reduction or by open reduction for a period of about a year (Fig. 3). It seems to be extremely fortunate that we should have this clue to an early diagnosis. The difference in the folds of the thigh are most apparent when the child is lying on his stomach, but they are also apparent when the child is lying on his back and is viewed from the anterior aspect.

#### NORMALS

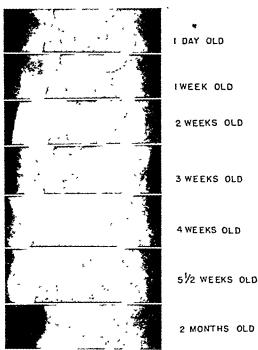

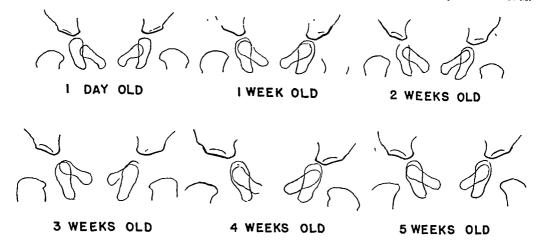

Fig. 4A.

The clinical sign of a widening of the perineum is present only when one or both hips is actually dislocated. We have not noticed a wide perineum in children when no dislocation has taken place. For this reason particularly, the textbook sign of the tip of the greater trochlear lying above the level of Nélaton's line is rather superfluous. This sign is only positive when the hip is dislocated, and dislocation is best determined when the examining hand feels the telescoping.

A positive Trendelenburg sign is likewise only applicable to older children who are standing. The diagnosis should be made before that time.

# Roentgenographic Diagnosis

When suspicion has been aroused that a dysplasia of the hip exists and roentgenograms have been taken, it is important to know what constitutes a normal hip in the newborn before one can be sure that dysplasia of the acetabulum exists. Roentgenograms of a one-day-old child show that a definite acetabular socket is present at birth. One cannot see this socket perfectly formed, since the three bones that make it up are not joined. The ischial and pubic portions appear as two separate ossifying centers or as two separate bones that overlap each other in a wishbone shape (Fig. 4). The iliac bone, however,

#### NORMAL HIPS

Fig. 4B. Tracings of normal hips. Notice how well the acetabulae are developed at even one day of age. By four weeks there is a definite acetabular shelf which is almost horizontal to the ground. The depth of the socket can be noticed in the original roentgenogram and is denoted here by a faint black line. Compare these normals with Fig. 5B.

gives us the greatest value in determining whether or not the acetabulum is normal. In all normal hips this iliac portion of the acetabulum presents a contour in which some portion of the tip of its outward curve is parallel to the base line or to the ground. In other words, the acetabulum seems to form a roof which is sufficient to hold the head beneath it if the child were to stand. In the dysplastic hip the curve is shallow, and at its outward tip it does not run parallel to a base line but slopes on upward toward the crest of the ileum.

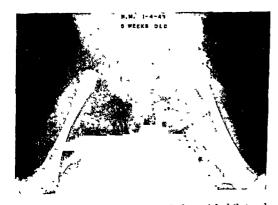

Fig. 5A. J. L., 5-week-old baby with bilateral dysplastic acetabulae without dislocation. Notice the difference in the thigh folds. Notice the shallow acetabulae.

Some authors, notably Wiberg, have drawn this base line through the center of the acetabular socket and have named it the "Y-line" because it runs through the center of the Y-shaped cartilage which is anatomically called the triradiate cartilage (which is formed by the suture line or joining together of the ischium, pubis, and iliac bones as they synostose). Other authors have drawn angles from this Y-line corresponding to the tilt of the iliac portion of the acetabular socket from the vertical. When this is done, it is seen that the dysplastic acetabulum subtends a larger angle than does the normal. This is a rather complicated type of measurement when the examining eye can easily pick up the fact that in the normal the roof is sufficient and that in the dysplastic acetabulum the roof is so shallow and oblique that the head could slip

The epiphyseal center for the femoral head is not visible at birth and does not appear for about six weeks, when it may be seen as a faint shadow that is a little denser than the surrounding soft tissues. It has been claimed that in older children this epiphyseal center of ossification is underdeveloped as compared with the normal hip. This is by no means a constant fact and should not be considered as a diagnostic sign. It is easy to tell when the head is subluxated in the roentgenogram because it lies on a higher level in relation to the acetabulum than does the normal. Normally it should lie

# DYSPLASTIC HIP

Fig. 5B. Tracings of five dysplastic hips without dislocation. Number 4 was dislocated one month later. Notice the obliquity of the acetabulae in all cases and the shallowness of the depth of the socket as denoted by the faint black line, which could be easily seen in the original. Number 5 has a severe dysplastic left hip where arrow points, but right hip too is not normal. This right hip later did not develop as well as the left hip did following its open reduction. See Fig. 7.

definitely below the transverse Y-line drawn through the center of the acetabulum.

Another sign, "Shenton's line," is present only when the hip is actually dislocated out of the socket, and since this is perfectly self-evident when it occurs, the sign need not be elaborated upon.

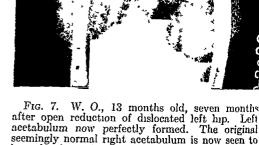

The normal child at birth, therefore, presents a socket which can be seen to be adequate in supporting the child's weight if the child were standing. In the subsequent weeks the socket deepens and the iliac portion of it becomes more parallel to the ground line. The dysplastic hip, on the other hand, remains shallow (Fig. 5). In cases in which a normal hip is present on one side with a dysplastic hip on the other the discrepancy in contour is very marked after a moment's examination. If one examines the film of a normal acetabular socket in an adequate light, one can see, by the end of the third week after birth, the faint white line which denotes the depth of the socket. This is occasionally seen in earlier weeks or even at birth (Fig. 4B). In the dysplastic acetabulum, on the other hand, this faint black line (Fig. 5B) is not easily seen and when it is seen, it shows that the socket is very shallow. When the child is 2 months old, this formation of a socket is quite marked in the normal and very inadequate in the dysplastic acetabulum. One must remember in the film made of a dysplastic acetabulum that the opposite or seemingly normal side is very often not entirely normal. Many of these children have a dysplasia which is more pronounced on one side than on the other. The side in which it is the more pronounced will subluxate more quickly since the normal function of the hip tends to allow this to occur.

#### Conservative Treatment

In considering the treatment of dysplasia of the hip or of actual dislocation of the hip, the socalled conservative treatment is not always the wiser choice. From a practical standpoint one knows that the conservative treatment will be employed by almost every orthopaedic sur-

Fig. 6. A 4-year-old child treated by conservative therapy for bilateral dislocated hip. Although tive therapy for phateral discounting the the acetabulae have developed satisfactorily, the hip is permanently and irrevocably ruined by bloodless reduction. Only salvage is possible now. A major tragedy. (Courtesy of Dr. D. M. Bosworth, who did not treat the hip in the beginning).

be a dysplastic hip and is less developed than the

geon in the beginning. In young infants it is frequently a great temptation to persist in this conservative treatment rather than to decide, in the best interests of the child's hip, to operate and employ a seemingly more radical therapy.

If a diagnosis is made within the first two months, there is no question that the best way to treat the patient is by separating the legs into wide abduction and internal rotation and holding them there with some appliance. Some prefer the use of pillows and metal splints. Others prefer plaster of paris. We have found the application of a plaster cast an extremely practical thing. We know that the legs are held in their proper position and that they will stay there. The nursing care is extremely easy. The cast is loose enough to allow the child to grow with only infrequent changes of plaster. The child need not stay in the hospital; he can be handled at home by the mother and can be transported with

At this early age it is rarely necessary in simple cases of acetabular dysplasia to employ an anesthetic in applying the plaster spica. Simple abduction and internal rotation of the femur are sufficient. The child cries and fusses a little, but this is relieved within a few hours. We do not like the frog-leg position of flexion and internal rotation as well as the above position. Changes of plaster are required, as a rule, every four weeks as the child continues to grow. On subsequent changes of plaster the child rarely makes an outcry. There is obviously no tension or stress on the head by this time. In

those cases where the hip actually has been dislocated, the author prefers to reduce the hips under an anesthetic. If the head has been dislocated, it is under some tension when it is inserted into the acetabulum during the reduction. There is always a danger that this tension will cause an aseptic necrosis or melting away of the epiphyseal center in the femoral head. This danger is not slight, as many have been led to believe. When it does occur, it is a grave tragedy in the life of the individual (Fig. 6). The hip joint is permanently and irreversibly damaged. For this reason, when tension is required to reduce a dislocation of the hip, it is believed much the wiser course to do an open reduction even in the earlier months of life. We have done this open reduction at as early an age as 5 months. This is much earlier than the time chosen by most surgeons. The length of time necessary to hold the child in plaster varies with the individual case. The determining factor should be the development of an adequate acetabulum by roentgenographic examination.

The youngest child whom the author has treated by this conservative method was 5 weeks old. It took until the child was 61/2 months old for the dysplastic acetabular sockets to develop sufficiently to discontinue the need for further plaster casts. This child's acetabulae could not be considered absolutely normal by roentgenographic examination until it was 11/2 years old.

In determining the proper time for discontinuing conservative treatment, one must remember that the shape of the femoral head as well as the acetabular socket is governed by the function

of the two bones acting in apposition against each other. The primary difficulty in the dislocated hip is in the growth of the acetabulum. The shape of the head, the author believes, is secondary to this. In some cases the acetabulum will not develop normally even though the head is applied correctly into the socket. The defective development center of the acetabulum is too abnormal to permit this. The femoral head, therefore, takes on the shape of the socket and not vice versa. There is no question, however, that the apposition of the two bones in their proper relationship to each other does seem to make the acetabulum develop a more nearly normal contour. Consequently, if an tabulum fails to develop normally when the bones have been properly apposed, operation should be considered necessary. The tissues which prevent the proper apposition of the bones -such as the capsule, excessive ligamentum teres, etc.—can be removed from within the socket. If necessary, the cartilage of the acetabulum itself can be gouged out a little to permit a firm socketing of the femoral head. Even the femoral head itself can be shaved down slightly without too great a risk of destroying its epiphyseal growth center. When this is done, the acetabulum is seen many times to develop normally although previously it had not been progressing satisfactorily under conservative measures. If operation is postponed too long, the altered shape of the femoral head no longer influences a proper development of the acetabulum, and by the same token, the altered shape of the acetabulum will not properly de-

There are four criteria which should determine the session of conservative therapy: (1) the use of too much tension at the time of reduction; (2) inadequate socketing of the head into the acetabulum in the postreduction roent-genogram; (3) the slipping out of the femoral head from the acetabular socket either while the child is encased in the plaster spica or at the time when the plaster spica is changed in the succeeding months; and (4) failure to develop a constantly deeper acetabular socket in the monthly check by roentgenogram.

velop the femoral head.

Gills has shown that the conservative treatment, or bloodless reduction of dislocated hips, gives satisfactory results in only about one-third of his cases. He has made careful observations on these cases and has followed them well into the ten-year period of treatment. Some have been followed as long as twenty years. He demonstrates that the acetabular socket does not develop to a normal shape in even the satisfactory cases until about five years from the date of the bloodless reduction. In two-thirds of the

cases the socket never develops properly following conservative treatment. It is true that most of his cases were not treated in the first weeks of life. Most of the children were treated when they were under 3 years of age, at a time when the dislocation is usually brought to the parent's attention.

This is a very strong reason for employing the seemingly more radical operative reduction when the hip has been dislocated. It has been the author's experience that when an operative reduction is done the acetabulum develops into a more normal contour very quickly. In Fig. 7 the left hip was first noticed to be dislocated when the child was 6 months old. Open reduction was done at that age. It was noticed at that time that the right hip showed a mild degree of dysplasia. The child was treated following operation with both legs abducted and internally rotated in a plaster spica. When Fig. 7 was made, the child was 13 months old. seven months following open reduction. The left acetabulum is seen to have developed into a perfectly normal hip joint within seven months. The right hip, on the other hand, which was only mildly dysplastic and which was treated by the conservative method, is not so well developed at 13 months as is the left hip which was severely dysplastic. The right hip was in plaster in abduction and internal rotation the same length of time as was the dislocated left hip.

The operation itself is not too difficult a procedure. Through an anterior approach the hip joint is exposed. The capsule is then cut off the rim of the acetabulum from its superior surface along its anterior surface as far medially as its deep surface. If a bottleneck constriction of the capsule exists, this can be liberated so that when the head is then replaced in the socket, no tissue will interpose between the head and the acetabulum. The ligamentum teres is usually elongated, and it folds on itself. When the head is resocketed, this forms an appreciable obstruction to proper apposition of the femoral head against the acetabular socket. It should be removed. It is rarely necessary to gouge out the acetabulum or to shave down the head slightly; however, one should not hesitate to do both of these things in order to obtain firm socketing of the head in the acetabulum. When this has been done, abduction of the leg, with internal rotation usually holds the head firmly in the socket. There is no need to do any plastic tightening of the capsular structures.

The total operative time is brief, and the longest period is occupied in applying the plaster spica after the wound has been closed.

These children stand the operation well, and there is not so much shock from the procedure as there is commonly supposed to be. The operation is usually done under open-drop ether anesthesia. The postoperative care is chiefly concerned with bringing the child back as quickly as possible to its normal food formula. Water is given during the first twelve hours, and the regular formula can be introduced at the end of that time.

At the end of six weeks the second stage of the operation is done. The plaster spica is removed. and osteotomy is performed to correct the anteversion of the femoral neck. The child is then replaced in a plaster spica, and the legs are held in position for a period of about six months from the date of the first operation. The convenience of the plaster spica allows the child to go home to its parents about ten days after each operation and represents a considerable economic saving. The peace of mind of the parents in having their children home is of inestimable value. Six months from the date of the first operation the plaster spica may be removed, and no further care is necessary except periodic check-up roentgenograms. This obviates the need of all orthopaedic appliances and the child may begin normal activity.

#### Discussion

Dr. Frank N. Potts, Buffalo—Dr. Thompson is to be commended for again bringing to our attention the necessity of the early recognition of congenital dislocation of the hip.

It is to be regretted that this excellent paper was not presented to a group less familiar with this subject than the orthopaedic surgeon. Unfortunately, the orthopaedic surgeon is the last one to see these cases instead of the first. However, it is our duty to constantly bring this subject before the general practitioner and the pediatrician. We know that, in principle, the earlier these cases are diagnosed, the better the opportunity for satisfactory treatment.

I have not had the experience of treating these cases as early as Dr. Thompson has. I can, nevertheless, subscribe in principle to practically everything he has suggested, with the possible exception of a very early open reduction. However, I must state that I cannot criticize that procedure because I am not familiar with it.

I believe the stress placed upon the cases representing potential dislocations is a very valuable contribution.

#### ASSOCIATION FOR RESEARCH IN OPHTHALMOLOGY, INC., TO MEET JUNE 13

The Association for Research in Ophthalmology, Inc., will hold its fourteenth scientific meeting on June 13, 1944, in the Hotel Sherman, Chicago, Ill. The program follows:

"Choline Esters with Mydriatic and Cycloplegic Action," Kenneth C. Swan, M.D., and Norman Gr White, M.S., University Hospital, Iowa City, Iowa.

"The Dissociation of Form and Light Perception in Amblyopia Ex Anopsia." Hermann M. Burian, M.D., and George Wald, Ph.D., Biological Laboratories of Harvard University.

"A Quantitative Test for Measuring Degree of Red-Green Color Deficiency," Louise L. Sloan, Ph.D., AAF School of Aviation Medicine, Randolph Field, Texas.

"A Study of the Pathogenicity of Diphtheroid Bacilli Isolated from the Human Conjunctivae," Charles Weiss, Ph.D., M.D., Isabella H. Perry, M.D., Marion C. Shevky, A.B., Mt. Zion Hospital, San Francisco, California. "Backflow Phenomena in Aqueous Veins of Normal and of Glaucomatous Eyes," K. W. Ascher, M.D.. Department of Ophthalmology, College of Medicine, University of Cincinnati, Cincinnati, Ohio. "Effect of Chemotherapeutic Agents on Cell Di-

Effect of Chemotherapeutic Agents on Cell Division of the Intact and Regenerating Corneal Epithelium Following Burns and Abrasions in the Rat," George K. Smelser, M.D., and V. Ozanics, M.D., Columbia University College of Physicians and Surgeons, New York.

and Surgeons, New York.

"Evaluation of the Use of Penicillin in Military Ophthalmology," John G. Bellows, Major, M.C., Billings General Hospital, Fort Benjamin Harrison, Indiana.

The officers of the Association are Frederick C. Cordes, San Francisco, California, Chairman; Maj. Brittain F. Payne, AAF School of Aviation Medicine, Randolph Field, Texas, secretary of the program; and Dr. Conrad Berens, New York City. acting secretary-treasurer.

# WARTIME PUBLIC HEALTH CONFERENCE

The Executive Board of the American Public Health Association announces its Second Wartime Public Health Conference and Seventy-third Annual Business Meeting in New York City, October 3, 4, and 5, 1944.

Meetings of several related organizations will take place Monday, October 2. Headquarters will be the Hotel Pennsylvania. The scientific program will be devoted to wartime emergency matters as they affect public health.

# TREATMENT OF PNEUMONIA WITH SODIUM SULFAPYRIDINE AND SODIUM SULFATHIAZOLE ADMINISTERED ORALLY

Elmer H. Loughlin, M.D., Richard H. Bennett, M.D., Samuel H. Spitz, M.D., and Mary E. Flanagan, B.S., Brooklyn

MANY reports have been published concerning the comparative efficacy and toxicity of sulfapyridine and sulfathiazole when used in the treatment of pneumonia. Although these studies have included the use of the sodium salts by intravenous administration, nothing has been presented concerning their use when administered orally.

The absorption of sulfapyridine and sulfathiazole from the gastrointestinal tract is irregular and at times inadequate. Because of this inconstancy of absorption which, to a certain extent, is due to their insolubility, satisfactory levels of these substances in the blood, as well as in the tissues, are at times difficult to attain. It is known that the effectiveness of these sulfonamides is partly dependent upon the levels reached in the blood and tissues.

Although sulfapyridine and sulfathiazole are quite insoluble, their respective sodium salts have been found to be freely soluble. Thus, if their absorption from the gastrointestinal tract depends upon solubility, the latter should be absorbed more rapidly and probably more completely.

Barlow and Climenko,¹ in a study of the pharmacology of these sulfonamides, as well as their respective sodium salts, found that sodium sulfapyridine and sodium sulfathiazole were more rapidly absorbed from the gastro-intestinal tract and produced higher blood levels, respectively, than sulfapyridine and sulfathiazole. They also noted that the blood levels were more easily maintained when the sodium salts were administered.

We recently reported studies<sup>2</sup> which we made during three-hour periods following the oral administration of 4-Gm. doses of sulfapyridine, sulfathiazole, and sulfadiazine, alone and with equivalent amounts of sodium bicarbonate, as well as similar administration of their respective sodium salts. We found that the latter were absorbed most quickly and usually produced significantly higher blood levels than did the original sulfonamide compound. We found, too, that the

administration of sodium bicarbonate with sulfapyridine, sulfathiazole, and sulfadiazine increased the absorption of the sulfonamide as evidenced by the blood levels obtained.

Realizing that the sodium salts could be so rapidly absorbed and that, in most cases of pneumonia, it was necessary to obtain optimum blood levels as quickly as possible, preferably without having to resort to intravenous chemotherapy, we decided to investigate the use of sodium sulfapyridine and sodium sulfathiazole when administered exclusively by mouth in the treatment of pneumonia.

#### Method of Study and Management of Cases

The pneumonia cases, which in this report numbered 445, were from the medical services of the Long Island College and Kings County Hospitals in Brooklyn, and were studied during the period beginning December, 1940, and ending in May, 1942. One hundred and seventy-three patients were treated with sodium sulfapyridine and 272 received sodium sulfathiazole. The reason for this great difference in the number of patients in each group was accounted for by the fact that only sodium sulfathiazole was given at the Long Island College Hospital, whereas at the Kings County Hospital patients admitted on alternate days were treated alternately with sodium sulfapyridine or sodium sulfathiazole. By chance, more patients suffering from pneumonia were admitted on days when the sodium sulfathiazole was being administered.

In each case, a history was taken and physical examination made. The clinical diagnosis of pneumonia was confirmed by x-ray examination. The sputum was cultured and typed for pneumococci by the Neufeld method, and the latter was confirmed by mouse inoculation. Blood cultures were taken on admission and subsequently on each day of fever. Studies of the blood and urine were made. Levels of the sulfonamides in the blood were determined daily.

Dosage.—Sodium sulfapyridine and sodium sulfathiazole were administered orally in two initial 2-Gm. doses an hour apart, then in maintenance doses of 1 Gm. every three hours until the temperature had returned to normal for approximately sixty hours. Bicarbonate of soda was not given. No intravenous chemotherapy was employed and none of the patients in this study received supplementary serum therapy.

Read at the Annual Meeting of the Medical Society of the State of New York, Buffalo, May 6, 1943.

From the Department of Internal Medicine, Long Island College of Medicine, Brooklyn.

This work was made possible by a grant from the Wintbrop Chemical Company, and the Dr. Frank E. West Fund, established by Miss Elizabeth Frothingham, and the John C. Warren Memorial Fund, established by Dr. Luther F. Warten, in memory of his son.

All patients were given an adequate amount of fluid to insure a urinary output of 1,000 cc.

#### General Etiology

Of the 173 patients treated with sodium sulfapyridine, pneumonia due to pneumococci occurred in 107, to streptococci in 6, to staphylococci in 2; and in 58, nontypable pneumococci, streptococci, staphylococci, and mouth organisms, some of which were apparently nonpathogenic, were found in the sputum. This latter group we have referred to as pneumonia of undetermined cause, and in the majority of these the response to chemotherapy seemed to indicate that they were of bacterial origin. Virus pneumonia was considered in some of these cases, because of normal leukocyte counts, suggestive history, and physical findings, although no special studies were made to confirm this opinion.

Of the 272 patients who received sodium sulfathiazole, 153 had pneumonia due to pneumococci, 9 due to streptococci, 10 due to staphylococci, and 3 due to Friedlander bacilli. There were 97 cases in which the cause of the pneumonia was indeterminate.

Distribution of Pneumococcal Pneumonias.—In 30 patients with pneumococcal pneumonia who received sodium sulfapyridine, and in 45 of those treated with sodium sulfathiazole, types I, II, and III pneumococci were the causative organisms.

The most frequently encountered types in those cases treated with sodium sulfapyridine were in this order: types VII, III, IV, VI, II, and XIX

In those patients treated with sodium sulfathiazole, the predominant types were in the order: types III, VII, II, VIII, I, XIX, and XIV.

Distribution of Friedlander's Bacillus Pneumonia.—There were three Friedlander bacillus pneumonia cases treated with sodium sulfathiazole. Two were type A and one was type B.

# Analysis of Cases (Table 1)

Age.—Of the 107 patients with pneumococcal pneumonia treated with sodium sulfapyridine, 63 were over 40 years and 2 of these were more than 80 years old. Their average age was 55 years.

Of the 153 patients with pneumococcal pneumonia treated with sodium sulfathiazole, 93 were over 40 years, and of these, 3 were more than 80 years of age. Their average age was 45 years.

Two of the patients with streptococcal and one patient with staphylococcal pneumonia, to whom sodium sulfapyridine was given, were over 40 years; while 5 of the patients with streptococcal and 9 with staphylococcal pneu-

monias treated with sodium sulfathiazole were over 40 years of age. The average ages of these two groups treated with sodium sulfapyridine and sodium sulfathiazole were 39 and 55 years, respectively.

Forty-eight of the patients with pneumonia of indeterminate cause treated with sodium sulfapyridine were over 40 years; while 74 of those treated with sodium sulfathiazole were over 40 years of age; and 2 of them were over 90 years. Their averages were 56 and 55 years, respectively.

Color.—The proportion of white to Negro patients in the pneumococcal pneumonias was 82.2 per cent white to 17.8 per cent Negro in the series treated with sodium sulfapyridine, and 79.0 per cent white to 21.0 per cent Negro in the series treated with sodium sulfathiazole. In the pneumonias of other cause, there were 88.0 per cent white and 12.0 per cent Negroes in the sodium sulfapyridine group and 89.1 per cent white and 10.9 per cent Negroes in the sodium sulfathiazole group.

Severity of Pneumonias.—The severity of the cases was based on duration of infection before institution of chemotherapy, bacteremia, extent of involvement, and antecedent diseases.

Duration.—The average duration of illness before institution of chemotherapy in the cases of pneumococcal pneumonia treated with sodium sulfapyridine and sodium sulfathiazole was eighty hours in each group. In the streptococcal pneumonias treated with sodium sulfapyridine, the average duration of illness was one hundred and forty-three hours; with sodium sulfathiazole, ninety-six hours; in the staphylococcal pneumonias treated with sodium sulfapyridine, one hundred and eight hours, and with sodium sulfathiazole, sixty-eight hours; and in the Friedländer bacillus pneumonias treated with sodium sulfathiazole, sixty-eight hours. While in the pneumonias of indeterminate causation which were treated with sodium sulfapyridine the average duration of illness was forty-one hours, in those treated with sodium sulfathiazole it was one hundred and seventeen hours.

Bacteremia.—Seventeen (15.9 per cent of the patients with pneumococcal pneumonia treated with sodium sulfapyridine had bacteremia. There were 4 cases of type III, 3 cases each of types II and VII, 2 cases each of types I and VIII, and one case each of types V, VII, and XX.

Thirteen (8.5 per cent) of the patients with pneumococcal pneumonia treated with sodium sulfathiazole had bacteremia. There were 3 cases of type I, 2 cases each of types II, VII, and VIII, and one case each of types III, V, XIV, and XX.

None of the patients with streptococcal,

staphylococcal, or Friedländer bacillus pneumonia had bacteremia.

Pulmonary Involvement,—Twenty-five (23.4 per cent) of the patients with pneumococcal pneumonia treated with sodium sulfapyridine had consolidation in two or more lobes. Of these, 14 had bilateral involvement.

Fifty (32.7 per cent) of the patients with pneumococcal pneumonia treated with sodium sulfathiazole had consolidation in two or more lobes, and of these 17 had bilateral involvement.

Twenty-one (31.9 per cent) of the patients with streptococcal, staphylococcal, and pneumonia of undetermined cause treated with sodium sulfapyridine had consolidation in two or more lobes, and of these, 10 had bilateral involvement. Fifty-nine (49.6 per cent) of the patients with streptococcal, staphylococcal, Friedländer bacillus, and pneumonia of undetermined cause treated with sodium sulfathiazole had consolidation in two or more lobes. Thirty-seven of these had bilateral involvement.

Antecedent Diseases (Table 2).—Thirty-eight (35.4 per cent) of the patients with pneumococcal pneumonia treated with sodium sulfapyridine and 56 (36.6 per cent) of those treated with sodium sulfathiazole had antecedent diseases. Twenty-four (36.4 per cent) of the patients with streptococcal, staphylococcal, and indeterminate pneumonia treated with sodium sulfapyridine, and 55 (46.2 per cent) of those treated with sodium sulfathiazole had antecedent diseases.

Included among the antecedent diseases were such conditions as congestive heart failure, acute coronary occlusion, generalized arteriosclerosis and senility, cirrhosis of the liver, chronic pulmonary diseases such as bronchiectasis and asthma, diabetes, carcinoma of the intestinal tract and lung, chronic alcoholism,

delirium tremens, pulmonary tuberculosis, syphilis, acute rheumatic fever, submersion, bulbar palsy with respiratory paralysis, and injuries, which included one case of fracture of the jaw.

#### Results (Table 3)

Recovered Cases.—In the pneumococcal cases the temperature fell to normal in an average of fifty hours after treatment with sodium sulfapyridine and in an average of fifty-six hours after treatment with sodium sulfathiazole. In the streptococcal cases treated with sodium sulfapyridine, the temperature became normal in an average of sixty-one hours; and in those treated with sodium sulfathiazole in an average of one hundred and fourteen hours. The temperature became normal in an average of thirty-six hours in the staphylococcal pneumonias treated with sodium sulfapyridine and in one hundred and thirty-seven hours in those treated with sodium sulfathiazole. In the cases of indeterminate cause treated with sodium sulfapyridine the temperature fell to normal in an average of forty-eight hours, while in those treated with sodium sulfathiazole it returned to normal in an average of seventy-two hours. In the Friedländer bacillus pneumonia cases the crisis occurred in an average of seventy-four hours.

In those patients with bacteremia who recovered, the blood stream was sterilized within twenty-four to forty-eight hours after therapy was begun.

Complications.—Suppurative complications, of which empyema was the only one, were infrequent. One case of type XVI pneumococcal pneumonia treated with sodium sulfapyridine was complicated by empyema, and 2 cases of type II pneumococcal pneumonia treated with sodium sulfathiazole were complicated by empyema.

Seven patients with pneumococcal pneumonia in which sodium sulfapyridine was used developed sterile nonpurulent pleural effusions which absorbed spontaneously, and 7 patients with pneumococcal pneumonia in which sodium sulfathiazole was used developed sterile nonpurulent pleural effusions, which also were absorbed spontaneously.

In the cases of streptococcal pneumonia treated with sodium sulfapyridine, empyema developed once. None occurred in those treated with sodium sulfathiazole.

Neither of the staphylococcal cases treated with sodium sulfapyridine developed empyema. In the staphylococcal cases treated with sodium sulfathiazole, one case was complicated by empyema and another by a nonpurulent pleural effusion.

In one case of Friedlander bacillus type A

pneumonia treated with sodium sulfathiazole, a sterile nonpurulent effusion was found. There were four sterile nonpurulent effusions in the cases of pneumonia of indeterminate cause treated with sodium sulfathiazole.

Fatalities.—In the group of cases of pneumococcal pneumonia treated with sodium sulfapyridine, death occurred in 9. The fatality rate was 8.3 per cent. Eleven patients with pneumococcal pneumonia treated with sodium sulfathiazole died. The fatality rate was 7.2 per cent. None of the patients with streptococcal pneumonia in either group died. None of the staphylococcal pneumonia patients treated with sodium sulfapyridine or sodium sulfathiazole died. Both patients with type A Friedländer bacillus pneumonia treated with sodium sulfathiazole recovered, but the patient with type B Friedländer bacillus pneumonia treated with sodium sulfathiazole died.

Nine of the patients with pneumonia of undetermined cause and treated with sodium sulfapyridine died; their fatality rate was 15.5 per cent; 14, or 14.4 per cent, of those with pneumonia of indeterminate cause treated with sodium sulfathiazole died.

Analysis of Fatal Cases (Tables 4 and 5).—Of the 9 patients with pneumococcal pneumonia treated with sodium sulfapyridine who died, 7 had bacteremia. Three of the 9 patients died within twenty-four hours after institution of chemotherapy. In 2 of these cases, and in 6 others, there were severe antecedent diseases which were complicated by terminal pneumonia. The fatality rate including all deaths was 8.3 per cent. However, when the cases of death within twenty-four hours and those with severe antecedent diseases were excluded, the fatality rate was 0.

Of the 11 patients with pneumococcal pneumonia treated with sodium sulfathiazole who died, 3 had bacteremia. None of the patients

died within twenty-four hours after beginning chemotherapy. In 8 of the cases, pneumonia as the terminal condition complicated severe antecedent diseases. The gross fatality rate with all the deaths included was 7.2%. The corrected fatality rate, with those deaths attributed chiefly to the primary antecedent diseases, was 1.8 per cent.

In the one case of Friedländer bacillus type B pneumonia treated with sodium sulfathiazole in which death occurred, pneumonia complicated diabetes and femoral thrombophlebitis.

Of the patients with pneumonia of indeterminate etiology who were treated with sodium sulfapyridine, 9 died. One expired within twenty-four hours after institution of chemotherapy. This patient, as well as 4 others, had antecedent disease conditions to which the cause of death reasonably could have been attributed, and in whom pneumonia was apparently the terminal condition. The gross fatality rate of this group was 15.5 per cent; the corrected fatality rate, 6.9 per cent.

In 2 of 14 fatal cases of pneumonia of indeterminate cause treated with sodium sulfathiazole, death occurred within twenty-four hours after institution of chemotherapy, and in these 2 cases, as well as in 5 others, there were severe antecedent disease conditions complicated by pneumonia. The uncorrected fatality rate, including all deaths, was 14.4 per cent, but when those cases in which death occurred within twenty-four hours or apparently was due to the antecedent condition complicated by pneumonia were excluded, the fatality rate was 6.2 per cent.

Toxic Reactions (Table 6).—Toxic reactions, with the exception of nausea and vomiting, which occurred, respectively, in 19.1 per cent and 8.1 per cent of the patients treated with sodium sulfapyridine and sodium sulfathiazole, were uncommon.

Sodium sulfapyridine and sodium sulfathiazole have produced less toxic reactions than sulfapyridine and sulfathiazole, especially less nausea and vomiting. The incidence of renal reactions was lower in the present series than in any reported series of cases treated with sulfapyridine, or sulfathiazole, and especially sulfadiazine.

#### Summary

1. Four hundred and forty-five cases of pneumonia, in which 173 and 272 were treated with sodium sulfapyridine and sodium sulfathiazole, respectively, have been analyzed.

2. The gross and corrected fatality rates of 107 cases of pneumococcal pneumonia treated with sodium sulfapyridine were, respectively, 8.4 per cent and 0 per cent, and of the 153 treated with sodium sulfathiazole, 8.2 per cent and 1.8 per cent. None of the patients with streptococcal or staphylococcal pneumonia died. In the groups with indeterminate pneumonia, the majority of which were of bacterial origin, the gross fatality rates of those treated with sodium sulfapyridine and sodium sulfathiazole were, respectively, 15.5 per cent and 14.4 per cent.

Dermatitis occurred in 1.7 per cent and 4.4 per cent, respectively, in the cases treated with sodium sulfapyridine and sodium sulfathiazole. Two of the latter group also had fever. Most of the instances of dermatitis, with the exception of one patient treated with sodium sulfathiazole who developed a severe erythema multiforme with ulceration, were manifested as macular and maculopapular rashes or simple erythema. In the patient with erythema multiforme, death was apparently not contributed to by the development of this condition.

Drug fever occurred in 2.3 per cent of the patients treated with sodium sulfapyridine and in 2.3 per cent treated with sodium sulfathiazole.

In two of the cases, or 0.7 per cent, in which sodium sulfathiazole was used, conjunctivitis developed.

Microscopic hematuria occurred in 1.7 per cent of those treated with sodium sulfapyridine, and 0.1 per cent of those treated with sodium sulfathiazole. In one case 0.4 per cent of those treated with sodium sulfathiazole, gross hematuria developed twenty-four hours after the temperature had returned to normal, at which time chemotherapy was discontinued without unto-

ward effect. There were no instances of renal calculi, renal insufficiency, anemia, leukopenia, or liver damage attributable to chemotherapy with either sodium sulfapyridine or sodium sulfathiazole.

#### Comment

Sulfonamide therapy should ideally combine maximum therapeutic effect and a minimum degree of toxicity. New preparations must be compared with sulfapyridine and sulfathiazole, as well as with sulfadiazine, which are, all highly efficient drugs. These drugs, however produce toxic effects which at times preclude their use or make it necessary to discontinue them during the period of illness in which their use is still required. We feel that, from an analysis of the 173 and the 272 cases of pneumonia, in which sodium sulfapyridine and sodium sulfathiazole were, respectively, employed, these drugs are about equally effective in the treatment of pneumococcal pneumonia, as well as pneumonia from other causes. They appear to us to be comparable to sulfapyridine, sulfathiazole, and sulfadiazine in the treatment of patients with pneumonia of at least average severity.

#### THE CAUSE OF PSORIASIS

ARTHUR E. GOLDFARB, M.D., New York City

Since 1857, when Ferdinand von Hebra¹ first defined the criteria which characterize the disease psoriasis as we know it today, much thought has been applied to the problem of discovering its cause. While many theories of causation have been advanced, the ones that have received the widest credence may be listed as follows:

- 1. Hereditary
- 2. Neurogenic
- 3. Parasitic
- 4. Metabolic
  - (a) High blood fat
  - (b) High blood protein
- 5. Diathetic, or the arthritism of the French School
- 1. Hereditary Theory.—It is generally conceded that there is in some families a greater tendency to the occurrence of psoriasis in its members. However, this disposition to develop psoriasis cannot be related to any functional or anatomic defect. Thus one arrives at the conclusion that explaining the cause of psoriasis vulgaris by assuming the existence of an hereditary defect alone provides neither an accurate functional estimate nor a precise anatomic concept.
- 2. Neurogenic Theory.—This theory was first advanced by the Salpêtrière School² and was based on the occurrence of individual cases following mental trauma. It has been attempted to connect such mental shock with the pathologic picture of psoriasis by claiming that the trauma stimulates the vasodilator fibers of the sympathetic nervous system, thus explaining the vasodilatation which is a part of the pathologic picture of psoriasis. Certainly, other than the relation clinically between mental trauma and the initial occurrence of psoriasis, there is no experimental or other evidence to support this theory.
- 3. Parasitic Theory.—The parasitic theory was first advanced by Lang, who had thought he had isolated the causative organism which he called the "epidermidophyton." Subsequent

workers have failed to confirm his work. Further doubt is thrown on this theory by Schamberg, who observed the disease in both individuals of married couples only twice in about three hundred families. On the basis of his experiments Schamberg arrives at this conclusion: "I do not believe that any living person possesses the scientific data that would warrant his dogmatically affirming or denying the truth of either the parasitic or the metabolic hypothesis."

4. Metabolic Theories .- These are two in number. The first was advanced by Gruetz and Buerger, 5.6 who claimed to have found high fat levels in the blood. They also claimed that the reaction to tolerance tests with large amounts of olive oil and cholesterin differed in patients suffering from psoriasis from that in normal persons. Schaaf and Obtulowicz,7 who repeated the work of Gruetz and Buerger by means of unimpeachable methods of known accuracy, conclude that neither with respect to the concentrations of the various lipoid fractions in the fasting serums nor with respect to the alterations undergone by the concentrations of these various fractions following the resorption of the test drink was it possible to detect any differences between psoriatic and nonpsoriatic individuals. Lipoid metabolism is normal also in psoriatics.

The second theory as to a metabolic cause was advanced by Schamberg and Ringer.<sup>3</sup> They showed that during the active stage of the disease a high protein diet brings about a spread of the eruption and that, conversely, a low protein diet is followed by improvement when no local remedies are applied. It should be noted that to achieve this result several weeks on a diet containing no more than 5 Gm. of nitrogen daily is required. To achieve such a level the individual has to live chiefly on vegetables. Suffice it to say that in other hands reliance on this low protein diet has not been attended by similar success.

5. Diathetic Theory.—All the theories of causation of psoriasis except the parasitic might be conveniently classified in this category, since they are at best only efforts to explain or elucidate a disposition to develop the disease. Greater light was thrown on this theory by the work of Koebner, who advanced as his theory of the causation a peculiar disposition of the psoriatic that is located in the cutaneous organ itself, which mostly can be proved to be hereditary, but which sometimes is also acquired, and

Read at the Annual Meeting of the Medical Society of the State of New York, Buffalo, May 6, 1943.

Hematuria Microscopic Gross Conjunctivitis	3 0 0	1.7	3 1 2	1.1 0.4 0.7

The corrected fatality rates were, respectively, 6.9 per cent and 6.2 per cent.

- 3. Sodium sulfapyridine and sodium sulfathiazole were used in the same manner. Supplementary intravenous chemotherapy and supplementary serum therapy were not employed in any cases.
- 4. The administration of both sodium sulfapyridine and sodium sulfathiazole was accompanied by infrequent toxic effects, which, with one exception of gross hematuria occurring after

the crisis, did not necessitate discontinuance of chemotherapy. Hematopoietic, leukopenic, and other renal reactions were not found in any cases in either series. Dermatitis, which in only one case was severe, appeared in about the same incidence as has been found with the administration of sulfapyridine and sulfathiazole.\*

\* ACKNOWLEDGMENTS: The members of the staffs of the hospitals named, notably Drs. Tasker Howard, George H. Roberts, Henry Wolfer, Joseph G. Terrence, Bernhard A. Fedde, and Harry Fried, permitted us to treat patients in their services with sodium sulfapyridine and sodium sulfathiazole (oral).

We wish to express our appreciation to Drs. William W. Carty, Heyes Petersen, John M. Edson, Saul Rotter, and to Misses Anne Smith and Margaret Hubbard for the clinical and technical assistance which they rendered. In addition, we wish to thank Sidney M. Karlton for his cooperation throughout this study.

#### TULAREMIA FROM NEW YORK STATE RABBITS

Two cases of tularemia, contracted from rabbits killed in Suffolk County, suggest that this disease may be more common among wild rodents in this state than is commonly supposed.

According to a comprehensive report of the two cases, submitted recently by Dr. I. J. Tartakow, Nassau County Department of Health, a party of four hunters shot twenty-five wild cottontail rabbits near Quogue, Suffolk County, on November 4, 1943. The game was divided among three members of the party, two of whom skinned and cleaned several of the animals for their own consumption and distributed the remainder among their friends. Both men remained in good health and none of the other persons who skinned, handled, or ate their rabbits became ill.

The third huntsman divided nine rabbits, which were his share of the kill, among his two brothers and two of his employees. All skinned and cleaned their own rabbits and none suffered any illness with the exception of one of the brothers, a garage owner, forty-eight years of age. This man dressed his two rabbits on the evening of November 4. His wife soaked them in salt water overnight and the following morning cut up and pot-roasted one in a pressure cooker at 320 F. for twenty minutes. The cooked meat was eaten by the man and his wife, his 13-year-old son, and his father-in-law.

A day or two prior to handling the rabbits, the garage owner had broken the skin of his right thumb and left index finger while doing some mechanical work. On the morning of November 6, he suffered severe headache, nausea, weakness, fever, and chills, and the wounds on his fingers appeared infected. On November 7, the lymph glands in both axillae became swollen and tender. There was moderate ulceration of the infected digital wounds with progressive enlargement of the axillary glands. Suppuration of the glands on the left side necessitated incision and drainage on December 23 and 27. Two subcutaneous nodules developed on the right hand and one on the left hand near the digital lesions.

Specimens of blood serum from the patient on December 8 and December 27 were found to agglutinate B. tularense in dilutions of 1:20 and 1:160, respectively, establishing the diagnosis. The other members of the family all escaped illness.

On November 6, the garage owner gave the second rabbit, already skinned and cleaned, to a laborer whom he had engaged to make repairs on his house. On his arrival home, the workman unwrapped the rabbit, placed it on a dish, and put it in the refrigerator. Later that evening, he held the animal in his hands long enough to show to his brother-in-law and then replaced it in the refrigerator.

law and then replaced it in the refrigerator.

On the morning of November 8, he developed severe headache, chills, and fever. A wound on his right thumb, which he had cut about a week before and which had become infected, appeared more inflamed. A few days later the glands in the right axilla became enlarged and sensitive, and a tender subcutaneous nodule appeared at the base of the right thumb. He was too ill to eat any of the rabbit which was cooked on the afternoon of November 8.

A specimen of the patient's blood was reported on January 3 as giving characteristic agglutination with B. tularense in a 1:1,200 dilution of the serum. None of the other members of this household, consisting of the patient's sister, her husband, and two children, all of whom ate portions of the cooked meat, were affected.

It may be assumed that both cases were contracted from the second rabbit, which was handled by each of the two patients. In the second instance, infection took place, apparently, during the brief contact which occurred when the workman unwrapped and placed the rabbit in the refrigerator and later when he showed it to his brother-in-law. It is significant that neither the wife of the first patient nor the sister of the second, both of whom handled the raw meat of this animal, became ill. Neither had any abrasions or lacerations.

the mixture. The liquid obtained in this way was then combined with the lemon juice for palatability. Forty lemons prepared in this manner usually yielded a gallon of vitamin concentrate. Four ounces (120 cc.) were administered to the patients as a daily dose. Sugar and water may be added for palatability.

The results of treatment are shown in Tables 1 and 2. This is a compilation of data for patients under observation since the inception of the study. In all, 62 cases are reported, of which 17 are control cases that were treated with two teaspoonfuls of milk sugar daily by mouth, and petrolatum locally. Of 17 control cases 3

improved, 3 showed no change, and 11 became worse during the period of observation.

In the treated group there were 45 patients. Of the 45 treated patients 30 improved, 12 showed no change, and 3 became worse.

which remains latent for years, and reacts to the most diverse internal and local stimuli, always with that chronic inflammatory cutaneous phenomenon, just as other organs manifest their vulnerability by other forms of transudation as a reaction to the most diverse occasional causes. He further states, in the same paper, that the therapy should be not only symptomatic, but should also be directed toward a decrease of the vulnerability of the entire cutaneous organ. These conclusions he based on both experimental and clinical grounds.

Wutzdorff<sup>10</sup>, writing later under the title of Contribution to the Etiology of Psoriasis Vulgaris concludes that psoriasis is based on a cutaneous disposition, which does not mean dyscrasia, but a peculiar cutaneous quality of reacting to external stimuli (mechanical, chemical, thermal) by developing lesions that are characteristic of psoriasis in response to stimuli that, when of the same intensity, would not have any effect on the skin of normal persons or would only cause a transitory inflammation.

If one examines the mechanism of reaction to mild injury, as elaborated by Lewis, 11 one finds that it consists of three phases, preceded by the liberation in the skin of histamine or a histamine-like substance. These are: (1) capillary dilatation; (2) arteriolar dilatation occasioned by a local nerve reflex; (3) an increase in the permeability of the capillaries, resulting in a wheal, which in normal persons may last for thirty minutes and is followed by a period of eight to ten minutes during which the area stimulated is refractory to the further action of histamine.

Thus, injury to the skin culminates in vascular dilatation and an increase in permeability. This is of particular interest in the light of Wertheim's description of the condition of the capillary loops in the papillae in psoriasis (quoted by Kromayer): in psoriasis the capillary vessels in the pathologically altered papillae look as if a dilated hose were slackly bending and winding as it continues its way to the tip of the papilla in such a manner that it seems almost completely to fill the stroma as well in profile as in the preparations of transverse sections. 12

Kromayer<sup>12</sup> concludes that the slight increase in the permeability of the capillaries, incident to their dilatation, produces a hyperalimentation of the epidermis which in turn results in the pathologically altered cornification of psoriasis.

Lewis<sup>11</sup> found that skin which had recently been subjected to whealing either by histamine, mechanical stroke, or other forms of stimulation, became irresponsive to subsequent stimulation. A repetition of the injury failed to produce a wheal. This irresponsiveness pertained only to the wheal; the occurrence of the flare, due to vascular dilatation, was not affected. Recovery from this refractoriness, in normal persons, begins in five to ten minutes and is uninterrupted, though a varying period elapses before full whealing is again obtained. Paterson, 13 using the same technic as Lewis, found that the cutaneous vessels were refractory to histamine during the eruptive and chronic stages of psoriasis. The return of the reaction was associated with improvement and preceded the disappearance of the lesions.

Using the same stimulus—i.e., mechanical stroke, necessary to produce the triple response in normal persons—one may produce in psoriatics the Koebner phenomenon. At least one may successfully accomplish this in 30 to 40 per cent of the persons affected with psoriasis. According to Lipschuetz (quoted by Bizzozero<sup>14</sup>) the following are the characteristics of artificial psoriasis:

1. Factitious psoriasis produced by excoriation reaches its climax when the papillary layer has been injured; it is of medium intensity if only the malpighian layer has been cut into; it is absent, on the other hand, if the injury is limited to the horny layer.

2. It may appear on the trunk as well as on the extremities.

3. It is absent in areas which have been previously treated with chrysarobin or pyrogallic acid

4. It is not exclusively limited to patients in whom the disease is in an eruptive stage, but may be provoked in patients who show only some isolated spots.

5. It becomes evident eight to ten days following trauma and occupies exactly and exclusively the area of the excoriations which have caused it.

Because of the relationship between mild injury and psoriasis and between mild injury to the skin and increases in capillary permeability, it was thought of interest to investigate the effect or citrin, so-called "vitamin P", on the course of psoriasis, since "vitamin P" has the effect of restoring pathologically increased capillary permeability (Szent-Gyorgyi and coworkers). The preparation of this substance used was citrin lemonade, made as follows:

Lemons of large size, 6 to 8 ounces each, were cut in half, and their juice extracted. The remaining rinds were then ground up in a meat chopper and the resulting mash was placed in an enamel-lined kettle and covered with water. This mixture was allowed to stand at room temperature for twenty-four to thirty-six hours. It was then placed in a basket centrifuge, where the liquid was separated from the solid portion of

The improvement which has been noted consists of diminution in the infiltration of lesions and a lessening of the scaling. In two of the patients there was complete disappearance of all

#### Summary

Five theories as to the causes of psoriasis are considered.

A relationship has been shown between psoriasis and injury and between injury and increases in capillary permeability. Citrin, so-called "vitamin P," which decreases capillary permeability, has been used in the treatment of this disease with the following results:

Of 45 cases treated 30 improved, 12 showed no change, and 3 became worse. In a group of 17 control cases under treatment with milk sugar orally and petrolatum locally, treated at the same time 3 improved, 3 showed no change, and 11 became worse.

#### IS ASPIRIN A DANGEROUS DRUG?

Aspirin, or acetylsalicylic acid, has been used in enormous quantities throughout most of the world for some forty-five years. Many persons seem to have a mild idiosyncrasy to this drug or to the other salicylates and consequently avoid its use; the vast majority take it with apparent impunity. Although toxic effects have been discussed in these columns, severe reactions are certainly rare in relation to the enormous quantities consumed. Deaths from aspirin have been reported; these appear to have been

more frequent in England than in this country. New evidence indicates that aspirin and the other salicylates produce a physiologic effect which cannot be ignored. About 1941, Huebner and Link of the Wisconsin Agricultural Experimental Station discovered that dicumarol when given by mouth induces a shortage of prothrombin in the blood. They found also that dicumarol could be qualitatively degraded to salicylic acid. Later, Link and his coworkers tested the action of salicylic acid it-When single doses of salicylic acid were given to rats kept on an artificial diet which was low in vitamin K, a decrease of the prothrombin in the blood occurred. Also if the salicylic acid was given over a long period, hemorrhages resulted; if vitamin K was administered the hypoprothrombinemia did not develop. More recently other investigators found that salicylic acid would act in the same way on human beings and that when vitamin K was administered simultaneously with the salicylic acid the fall in prothrombin levels was prevented. The

administration of vitamin K after the production of hemorrhage by dicumarol or salicylic acid, however, is of little use.

These observations offer a plausible explanation of such events as the report of a British physician in 1943 concerning the development of nosebleed in 3 cases after taking large doses of aspirin or the fre-quent occurrence of bleeding in patients with rheumatic fever who are receiving large doses of salicylates. Such observations suggest that patients who are required to take salicylates in large quantities for a long time should also receive prophylactic doses of vitamin K. When, however, hemorrhages occur after the taking of dicumarol or the salicylates, vitamin K is not likely to be effective; then proper treatment may include the giving of a blood transfusion.

The mass of evidence so far available indicates that aspirin and the salicylates are among the least toxic of active pharmacopeial preparations. This status, however, should not be interpreted as an excuse for failure to recognize hazards connected with their abuse or even under certain circumstances of established usage. Their ability to produce hemorrhage in some cases appears to be counteracted by early administration of vitamin K. It does not now seem necessary to administer vitamin does not now seem necessary to administer vitamin K to all patients receiving salicylates; those who are to receive large doses for a long time may appropriately be given vitamin K.-J.A.M.A., March 18, 1944

#### TRIALS OF A TAXPAYER

A Chicago paper recently carried this story: An elderly woman equipped with a mechanical hearing device and an income-tax form waited in line for four hours in the Oak Park offices of the Internal Revenue Bureau, only to shout helplessly, when she finally obtained the ear of a deputy: "I

can't hear a word you're saying. I've stood in line so long my battery has run down." She went to buy a new battery, with the observation that in equity and justice it should be a deductible item in the protein and the Hard of her return .- Bull., N.Y. League for the Hard of Hearing

# THE IMPORTANCE OF LATENT PARENCHYMAL DISEASE OF THE LIVER IN SURGERY

ABRAHAM O. WILENSKY, M.D., New York City

TN MANY cases of disease of the liver, there is L evidence to show that some form of elusive or obscure hepatic parenchymal injury had preceded the onset of any clinically recognizable illness. That the disease had previously been symptomless is undoubtedly due to the fact that there was an insidious onset, that the episodes had been comparatively mild, that the continued development of the disease and/or lesion had been very slow and very prolonged, and that the symptomatology had been of the kind which is easily dismissed or disregarded in the vicissitudes of daily life. In rather uncommon instances, this has been demonstrated by tests of hepatic function; in more common instances it was visualized at exploratory operations, done for apparently other indications, by gross anatomic changes indicating the preceding damage or injury or its secondary effects.

In clinical practice such a breakdown can occur and be recognizable in persons whose hepatic structure and function had previously been normal, or, perhaps more probably, in persons in whom some hepatic damage had already existed as a multiple incident and in whom, in between these episodes, a partial or complete anatomic and functional recovery had taken

place.

From the factual knowledge summarized in a previous communication it must be concluded that:

The number of apparent and/or apparently unrelated potential causes must be large and must include the following: chemical bodies introduced from without the body or produced within the body as a normal or abnormal metabolic event and, in either case, either not neutralized or not promptly excreted; bacterial infections; and tissue toxins of various origin and chemical structure produced by destroyed or degenerating tissue (as after trauma or burns).

2. It is probable that in the vast majority of cases some combination of agents is the essential provocative cause. The nature of this combination is not as clear as we should like it to be. The most common participating agent is alcohol. It seems that ethyl alcohol may play a role either by itself, or because of other contaminating alcohol (amyl alcohol), or because of some of the chemical by-products which are formed in its production or in its later storage in charred barrels. Later in the development of these injuries, an important factor is inanition seen in the physical examination of the patient and demonstrated in the study of the blood serum proteins. The observable hypoproteinemia is frequently excessive. With it there is demonstrable diminution in vitamin B<sub>1</sub>. The undernourishment has been thought by some to be an important agent in the develop-

ment of these parenchymal changes.

It seems that bacteriologic infection may be a powerful adjuvant to any of the other agents which can produce injury in the liver. Either the previous injury lessens the resisting power of the liver and so facilitates infection; or infection inhibits certain protective powers of the liver so that injurious substances are not destroyed or sufficiently neutralized before hepatic injury can be produced; or, if the latter be already present, infection facilitates its further progression. In this regard intercurrent infection of the gallbladder and/or the biliary duct system becomes a most important item. It may furnish the necessary stimulus to a hastened further advance of the already existing hepatic damage. Contrariwise, it may itself be much facilitated by the already existing hepatic damage.

- 3. Sensitization of the liver occurs because of the repetitions of these episodes, opportunity for which is sufficiently abundant in everyday Therefore the liver becomes increasingly susceptible to the repeated toxic damage. This helps materially to explain why some patients go through an overpowering fulminant course to death even after a first injury while others show less severe or mild symptoms and eventually recover, or possibly have no perceptible symptoms. A vicious circle is sometimes thus produced.
- 4. The differences in duration and in the manner of the development of this clinical and pathologic complex, in the symptoms, in the suddenness and the dramatic effect of the clinical manifestations, and in the rapid culmination in death, or in the more protracted course with apparent temporary improvement but, nevertheless, slow progression to the terminal stages hereinafter to be discussed, or in the repetition of mild episodes with incomplete restoration to the normal in the remission periods and the passage into the terminal picture hereinafter to be discussed, seem to have important relations to the size of the dose of the causative agent, to the number and frequency of its repetitions,

( 多一 ) 二世 ( 世代 )

to the time limit in which the latter is delivered, to any intercurrent duct obstruction, and to various forms of preceding sensitization of the body to diverse toxic bodies. When the toxicity of the causative agent is sufficiently powerful and the latter is applied with sufficient intensity, the resulting hepatic injury is sufficiently large so that immediate death may occur. illustrated clinically in the fatal acute cases of yellow atrophy of the liver or in those dramatic fatal cases of the hepatorenal syndrome which sometimes occur in the postoperative period after lightly undertaken operations upon the gallbladder and biliary tract for comparatively simple conditions apparently devoid of any undue risk and danger.

## Hépatitis .

Some degree of hepatitis is always present, The forms of yellow atrophy are the maximum potential ultimate manifestations to which any and all of these destructive changes may lead. The initial stage of hepatitis may be clinically most acute and promptly fatal. The fatal cases not only include the cases of acute yellow atrophy but also instances of a less violently destructive process which have been clinically segregated under the generic term of "toxic cirrhosis." The differentiation is, perhaps, an academic one. These are, perhaps, the only cases in which a single episode of liver injury occurs and repititions of the injury are prevented by the immediate fatal outcome. An equally acute onset with an almost equally

An equally acute onset with an almost equally marked clinical symptomatology may rarely be followed by an apparently complete clinical recovery. In the usual run of cases, this does not necessarily imply an equally complete anatomic healing and restoration of physiologic function. From this easily recognizable severe form of injury and disease, all gradations occur clinically, down to those in which evidence of disease is at a minimum and is sometimes even imperceptible to the clinician.

In other words, the liver damage may be so mild and ephemeral as to be unrecognizable unless one is on the lookout. In the latter cases, indications of the presence of disease are to be found only in changes of liver function or in the appearance of otherwise unexplainable jaundice. Any degree of jaundice occurring under such conditions is an indication of hepatitis even in the absence of any laboratory data.

In the fibrotic liver (chronic interstitial hepatitis-cirrhosis), the consensus of opinion (Kretz, Kelly, McIndoe, McNee, Ghon, Moon, Laennec, Mann, McCallum) is that the continued or repeated action of these agents either alone or, more especially, in combination with

other factors results in the production of repeated episodes of acute cellular degenerations with insufficient regeneration of the hepatic parenchyma in the intervening periods; that as a consequence of this there follows a chronic diffuse hepatitis indicated by further degenerations and necroses due sometimes to other mechanical factors, and to insufficient and increasingly futile attempts at regeneration of the parenchyma; and that, finally a productive proliferation of interstitial fibrous tissue occurs. Because of this the entire parenchyma becomes totally renewed several times, and this results in a complete architectural transformation of the parenchyma. This alteration or destruction of architectural pattern seems to be the distinguishing characteristic of the Laennec cirrhotic lesion in the liver as opposed to any other form of chronic productive connective tissue change, instances of which are very common, as pointed out in a previous communication.

Numerous experiments have shown that the liver has an extraordinary capacity for regeneration. Even after the removal or destruction of large portions of the liver, regeneration is accomplished by the formations of new lobules of normal size, shape, structure, character, and vascular supply, as shown by repeated biopsies and by laboratory tests of hepatic function. The architectural pattern in such regenerated livers is many times indistinguishable from that of a normal liver and no fibrotic changes follow.

This type of change and result usually can only follow a single relatively mild injury. It cannot and does not, however, follow a continued or repeated injury of a similar or, perhaps, of a dissimilar nature. Repetition, or continuation, of the injury causes a chronic diffuse hepatic inflammation the essential features of which are degeneration and destruction of hepatic cells and subsequent attempts at repair marked by regeneration of cells from those remaining and by proliferation of connective tissue. Nevertheless, the conception that this is always synonymous with cirrhosis, as ordinarily understood, is somewhat erroneous even if it be so generally accepted.

It is very difficult to establish or even estimate the degrees of anatomic restoration or functional recuperation either after a single or even after repeated parenchymal injury. And there is some evidence to show that in the present state of our knowledge, one may not lightly escape the thought that perhaps no complete anatomic and functional recovery ever occurs even after a single episode of injury or disease. At any rate, it seems certain that any more or less successful attempt at restoration, both anatomic

and physiologic, to the normal after a first injury becomes progressively less effective after subsequent and repeated episodes.

After repeated episodes—and this repetition of episodes is undoubtedly the rule-latent anatomic changes and mild disturbances of physiology are present. The possibility of such increasing latent damage in structure or function which may gradually progress over many years until easily recognizable clinically, and until hepatic insufficiency eventually supervenes, is shown by those rare instances of hepatic fibrosis (cirrhosis) in which a story of one or more previous episodes can be elicited. Such observations, including the clinical and laboratory (biopsy) demonstration of the repetitions of acute and subacute episodes, have been reported by Bloomfield, 10 Wilson and Goodpasture, 11 Connor,12 Abramson,12 Krarup and Roholm,14 and Whiteacre and Fang. 15 Similarly, they have been able to demonstrate the latent periods in between the succeeding flare-ups until terminal exitus. Bloomfield points out the analogy between these long-drawn-out liver cases to the course of glomerular nephritis (Addis16).

Such latent hepatic disease is of most importance in other manifestations of disease of the liver or of the gallbladder and biliary tract. From the point of view of the surgeon, they are of practical importance as the cause of unexpected events and complications after operation upon the latter. When it is visualized as an unforeseen lesion during the laparotomy, the surgeon must be able to integrate the liver lesion with the other clinical manifestations in order to make an accurate judgment of the causal relation of the one to the other, in order to be able to make reliable prognostications, and in order to be able to advise any available precautionary measures against untoward complications or events in the immediate postoperative period or for the possible arrest of the process and the resultant prolongation of life.

Latent hepatic disease is of great importance to the obstetrician in that it may act as an underlying disability upon which obstetric yellow atrophy, toxic hepatitis, and some forms of toxemia of pregnancy are built.

To both internist and surgeon, latent hepatic disease forms, very probably, the underlying nidus or the state of lessoned resistance upon which the demonstrable lesions which complicate thyrotoxicosis are built.

Lastly, latent hepatic disease is, to my mind, undoubtedly the precursor of those cases of hepatorenal symptoms and lesions or "liver death" about which so much has been said in recent years (Wilensky<sup>17</sup>). The phenomena

are not entirely confined to operative cases of disease of the gallbladder and biliary tract but occur also in a miscellaneous collection of other conditions in all of which they are totally unforeseen. Some illustrative examples are the following:

Case 1.—A child aged 9 months was admitted to the hospital with a typical picture of acute intestinal obstruction of approximately twenty-four hours' duration, due to an acute intussusception. The child was immediately operated on, and during the operation the intussusception was easily reduced. During the next eighteen hours the temperature rose to above 106 F.; tremendously toxic symptoms developed, and the child died. Postmortem examination showed negligible changes in the liver and some slight degenerative changes in the kidney. There was no time for chemical, bacteriologic, or other laboratory studies before death occurred.

In the gallbladder and biliary tract cases the operative findings immediately establish the fact of the previous liver injury and disease and that all is not well. Events and complications are then more or less anticipated in the postoperative period and even later. In the other cases, when, as very often happens, exploration is not done, or is insufficiently done, there is no inkling of the underlying disturbance or of its potential subsequent events and no objective evidence of the true condition is available until a postmortem examination is made.

It is instructive to compare the phenomena in cases of liver death with similar phenomena in those of outstanding infection:

Case 2.—A young man was admitted to the hospital with the diagnosis of "chronic appendicitis," and an appendectomy was done. During the next thirty-six hours his temperature rose to well over 106 F.; the patient showed marked signs of toxicity, and death occurred. Postmortem examinations showed peritonitis, distinctive yet in an early stage of development, and there were inconspicuous changes in the hepatic and renal cells.

Case 8.—Another young man was admitted with chronic osteomyelitis of the femur, and osteotomy was done. Prior to operation there was no fever, and there was no reason to think that bacteremia was present. Nevertheless, operation was followed immediately by a progressive rise in temperature, by increasing signs of general infection, by a growth of bacteria in the blood culture, and by death within seventy-two hours. Postmortem examination showed the usual changes incident to a general infection but no special morphologic changes in the liver or the kidney.

The resemblance to cases of liver death are more than incidental, since infection is a powerful destructive agent upon the liver parenchyma. The remarkable thing is that these effects are not observed more often.

The explanation and differentiation of the clinical phenomena are difficult when one compares them with cases of postoperative acute cholangitis. Many patients for whom acute cholangitis is a new postoperative condition or an extension and exaggeration of a preceding lesion show high fever and marked toxicity immediately after operation. Death within twenty-four to thirty-six hours after operation is common. The blood cultivation is frequently positive and the pathologic picture in the liver shows acute inflammatory foci around the ducts. Degeneration of the parenchymal cells and miliary abscesses are common.

#### Surgical Considerations

In practical surgery, the importance of latent hepatic parenchymal disease lies in the degree of any functional incapacity which it causes. This varies a good deal, and though usually there is, there is not always an exact correspondence between anatomic change and physiologic disturbance. Nor is there usually any indication of the amount of reserve which is still potentially present in the liver.

The best and most competent idea of all of this is obtained from an integration of the clinically observed facts with some laboratory determinations. On the clinical side a much greater degree of invisible pathologic change is indicated when jaundice is present. On the laboratory side the following considerations are valuable.

Hypoproteinemia.—Hypoproteinemia resulting from the inability of the liver cell to synthesize plasma proteins despite an adequate intake of precursor material is a pathologic disturbance of liver function caused by intrinsic hepatic parenchymal disease or degeneration. This is found most demonstrably in the yellow atrophies and in the portal type of cirrhoses and less often in other liver conditions. In the experience of Davis and Getzoff, 18 this has always been associated with a general reduction of liver function of a rather marked grade as shown by the intravenous hippuric acid test.

The conclusion seems inevitable that all cases faced with abdominal operations, biliary tract and gallbladder cases as well as others, should be investigated with this point in mind. Any demonstrable hypoproteinemia should be corrected. If it is apparently uncorrectible, the deficiency should be regarded as indicating a very serious stage of disease. Second, the advantages of a high protein diet are obvious, prophylactically as well as therapeutically. In this regard vitamin B seems an important accessory, as shown in the work of Gyorgy and Goldblatt. 19

Blood-Clotting Function.—In the presence of sufficient hepatic parenchymal disease, the normal blood clotting function becomes disturbed and this is most marked in long-continue jaundice. When there is reason to suspect latenthepatic disease, even in the absence of jaundice and especially when it is present; the blood clotting function should be investigated and corrected as far as possible.

Renal Changes (Hepatorenal Syndrome).—It the later stages of latent hepatic disease, and certainly when this becomes clinically apparent renal changes become demonstrable and the change from the normal can be used clinically as a rough measure of the amount of hepatic dysfunction.

These three factors, when taken in conjunction with the clinical manifestations, should give a very good indication of the amount of hepatic functional damage, of the possible available reserve, of the ability of the patient to withstand an operative insult, and of the probable prognosis.

In practical surgery the macroscopic evidences of latent hepatic disease may not be visible during the operative exploration. When changes are visible, they indicate that the latent disease is in an advanced stage. Nevertheless, recovery can occur from the immediate form of illness and from the operative procedure. The visible evidence of latent disease should, however, endow us with caution in making any prognostic statement, as it does not preclude the possibility of recrudescence or advance of the process to a further irreversible stage. In addition, it must be remembered that any hepatic fibrosis may by itself be productive of secondary effects equally as bad, if not worse, than the original injury.

In any event, it must be understood that the chances are more than good, that there will be further symptoms, and that the patient will not be entirely well; and that there may be further serious disease eventually culminating fatally.

On the other hand, when the evidences of previous disease are so demonstrable, unexpected and frequently serious and even fatal events follow in the immediate postoperative period, or even shortly thereafter after the discharge of the patient from the hospital, which is only understandable because of the preceding liver injury and damage.

Precautionary Preoperative Measures.—In some instances it is possible to suspect before operation that previous liver injury had taken place, as a consequence of which there are interstitial changes in the liver. When these are suspected and possibly corroborated by some of the tests of liver function, it becomes necessary to revise any previously held opinion regarding the risks

of operation. The suspected changes might very well form serious objections to the performance of any operation of an elective nature. And in compulsory operations they might indicate a greater effort in the exercise of precautionary preoperative measures for the prevention of any postoperative hemorrhage, in the employment of a different form of anesthesia, or in a change in the usual operative technic or procedure, which might help to obviate or lessen the immediate effects of the operative trauma, or the occurrence of effects of any resultant postoperative complications.

Practically speaking, the most important precautionary measure which is available is encompassed under the general provision of an improvement in the general nutrition. abundant supply of carbohydrate must be combined with an adequate supply of protein. The latter is especially important in order to counteract the hypoproteinemia which is present. For the latter purpose transfusion of whole blood or of plasma, or the enteral or parenteral use of any of the various aminoids preparations, in addition to adequate protein intake, are necessary. From the latest available studies it seems that an adequate supply of vitamin B is also most essential.

# Summary

Many agents, either alone or in combination, cause insidious degenerative changes in the hepatic parenchyma with various forms of hepatitis which are eventually followed by fibrotic change. These latent conditions may be unexpectedly exposed to view during operation or discovered thereafter. Their importance, surgically, lies in the amount of the resultant liver damage. The best idea of the latter is found in clinical observation integrated with demonstrable grades

of hypoproteinemia, demonstrable interference with the blood-clotting function, and with demonstrable renal changes, combined with the ordinary tests of renal and hepatic function. These latent hepatic parenchymal and interstitial changes may determine an unexpected postoperative fatality, or may appear later as a continuation or recrudescence of the previous lesion. When, rarely, the liver disease can be suspected and, perhaps, proved before operation, it might form a strong objection to the performance of any elective operation; or would compel, in compulsory operations, preoperative precautionary measures to obviate or lessen, if possible, any postoperative complication or events.

# TUBERCULOSIS CASE-FINDING

It is fully realized that it is essential for our future to win this war, and the finding of a case of tuber-culosis, with the prevention of its further spread, is as definite an act toward winning the war as the destruction of an enemy plane or tank. This is especially true of our industrially employed. A case of tuberculosis in a worker not only removes an important element in production but also necessitates the dissipation of the energies of many others to re-tore him to health. These people can and should be engaged in the more fruitful work of winning this war. The physicians, nurses, social workers, educators, attendants, dietitians, and all others directly or indirectly related to the care of a tuberculosis case will find that they have only a minimal

amount of time to care for tuberculosis. Although by case-finding their load will be greater, the removal of an open case from industry will, in the long run. prevent the increased rise in tuberculosis morbidity and mortality which we greatly fear. The industrial case, therefore, is more important than just any case of tuberculosis.

When industry and the worker realize the terrible cost in manpower and human suffering that tuberculosis entails and that a method of control is feasible, then case-finding in industry will be more eagerly accepted and may, in fact, be one of the outstanding contributions toward public health that will survive this war.—Irving R. Tabershaw, M.D., in Industrial Medicine, March 1943

# PENTOTHAL SODIUM ANESTHESIA IN MAJOR SURGERY

D. BATTAGLIA, M.D., and B. A. WINNE, M.D., Johnstown, New York

N SPITE of earlier experiences with sodium amytal and related barbiturates which were prepared for parenteral use, there were sufficient undesirable reactions from the single dose administrations to cause many to regard with suspicion the intravenous route in general anesthesia. Without doubt, the ideal anesthetic agent may be defined as one which is suited for any type of surgical procedure, and which produces the least physiologic disturbance. It has been observed that pentothal sodium fulfilled this requirement more closely and more constantly than any of the other agents used for general anesthesia. The role of pentothal sodium in minor surgery has been definitely established. In major surgery there is still considerable doubt as to its adequacy. To those who fear the intravenous route and its relatively rapid effect on the patient, it may be stated axiomatically that any inhalation anesthesia produces its effect only after it is absorbed from the respiratory tract into the blood stream. Obviously, intravenous injection accomplishes this result simply and directly.

The belief that pentothal sodium in major surgery should be relegated to the status of a basal anesthetic or supplementary adjunct to another type of anesthesia is not well founded. There are no exact pharmacologic or physiologic standards by which one can foretell the total effect on a patient of a measured amount of the anesthetic used. The individual response of a patient is unfortunately subject to too many variables which in most instances are neither constant nor uniform. It has been shown repeatedly that major surgical operations of a similar nature and severity have been performed on similar age groups and types with a wide difference as to the total dosage of sodium pentothal used in each case. Also of significance is the fact that the total dosage for the operation in some cases was greatly exceeded by the amount administered in other cases before the surgeon could even make his incision. Any agent which requires the constant supplementary effect of other drugs to produce a state of surgical anesthesia is fundamentally inadequate, and in some cases it is an exaggerated, complicated, and dangerous form of preoperative medication.

Pentothal sodium anesthesia is neither basal nor supplementary. It is totally adequate for any type of major surgery. Properly administered according to the individual requirements of

Read before the Montgomery County Medical Society, December, 1941, and before the Fulton County Medical Society, January, 1942.

each case, its use permits delicate and easily varied control of the depth of anesthesia during any phase of the operation. This exactness and simplicity of administration cannot be so easily achieved with any other type of general anesthesia. A prevalent belief which is the basis for much of the objection to the use of intravenous anesthesia in major surgery is that there exists a relatively small margin of safety between the maintenance dose and complete respiratory ar-It' was our observation that very deep anesthesia could be safely achieved and maintained with intravenous sodium pentothal as the sole anesthetic agent, and that this margin is comparatively more safely under the control of the anesthetist. Since 1938 we have used pentothal sodium anesthesia in practically 95 per cent of our major cases, regardless of the basic pathology present, and without too strict attention to the then accepted contraindications for the use of the drug. As a result of this experience a paradoxical conviction gradually evolved. Many of these so-called contraindications apparently became actual indications for the use of the drug.

The systemic effects of pentothal sodium anesthesia have been observed to affect the physiology of the patient very little. The induction period is very rapid. There is no excitement stage. The pulse and blood pressure vary slightly throughout the operation. The respiration becomes somewhat shallow and the rate is lowered. Routine laboratory work, including blood counts, urine analyses, coagulation, and bleeding times, shows no significant changes. No demonstration to date has been made of the exact fate of pentothal sodium in the body. Observations by others have shown that electrocardiographic studies after anesthesia in cases with definite cardiac damage were no different from those before anesthesia. Other than a slight elevation in blood sugar in some cases, no changes occurred in the blood chemistry. No alteration in liver function was noted. It has been shown that repeated administration of pentothal sodium has no apparent effect on the physiology of the usual laboratory animals, and many patients tolerate repeated anesthesias with this drug remarkably well.

#### Method of Administration

One of the most important factors in the induction and maintenance of this anesthesia is the preoperative medication of the patient. For the average adult case, a standard routine is used. The night before operation at the hour of sleep

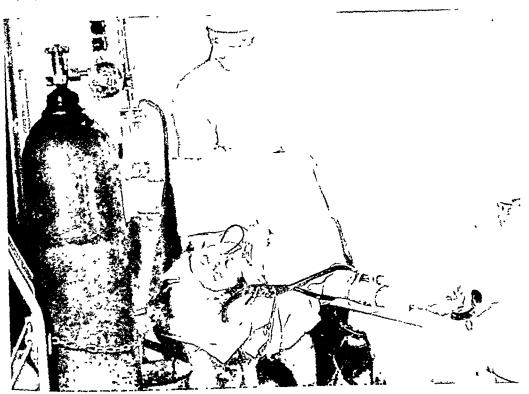

Fig. 1. Photograph illustrating the apparatus used for intravenous pentothal sodium anesthesia in major surgery.

11/2 grains of nembutal are given. Two hours prior to operation this dose is repeated, and the same amount is administered one hour later. One-half hour prior to the operation 1/6 to 1/4 of a grain of morphine sulfate and 1/150 of a grain of scopolamine or atropine are injected hypodermically. This dosage, of course, varies with the age and general condition of the patient. emergency cases only the morphine-scopolamine injection given intramuscularly, or 1/6 to 1/4 of a grain of morphine sulfate intravenously may be used. There have been favorable results in some emergencies with no preliminary medication, but it is believed that this undoubtedly does prolong the induction period. Adequate preoperative medication assures a smoother anesthesia, and diminishes the total amount of pentothal used. The psychic effect on the patient is of unquestionable value. The patient is brought to the operating room with the eyes covered and is usually quite drowsy and unconcerned.

The arm is placed at right angles to the patient and fastened to an arm board. Both arms can be made available in this way, especially if the superficial veins are scarce and ill-defined. A small wisp of cotton is strapped to the patient's nose.

A 5 per cent aqueous solution of sodium pentothal is prepared from a standard ampule containing a gram dose. The practical syringe to use is one with a 20-cc. volume, since this corresponds to the dosage in the ampule and many cases will fall within 5/10 to 1 Gm. total dosage limit. A 20gage needle is excellent, but a larger one can be used if practicable. The solution is injected slowly while the patient counts aloud. After ten to fifteen seconds, when about 6 cc. of the solution has been injected, the patient will stop counting and fall into a condition resembling a deep sleep. There is no excitement stage. The respiration is shallow and is indicated best by the cotton wisp on the nose. The needle is left in the vein with the syringe strapped to the arm. This is the simplest and most reliable technic for subsequent dosage. The surgeon then tests the patient for sensibility by pricking the skin. The nature of the patient's response and the muscle tone must be watched carefully to determine the need for further dosage. The muscle tone is gaged by testing the lower jaw frequently. All this usually takes from twenty seconds to one minute in most cases. The tongue must be carefully watched and a patent airway constantly maintained. Prior to reaching the deeper planes of anesthesia, many patients go through a period of peripheral dilatation which may cause some oozing in the incision. This is transient and causes no real trouble. The eye signs are not too reliable.

It is important at this time to stress again that the dosage of this drug is not constant or fixed for any type of case or individual. Every patient is a law unto himself. Several important facts must be borne in mind.

First, the total dosage method is never to be used, any more than one should give the patient a 4-ounce tumbler of ether or any other anesthetic at the beginning of an operation. anesthetist is always guided by the response of the patient to the initial dose. When the patient has stopped counting he should be careful to give only the amount necessary to bring the patient to, and maintain him at, a desired level of anesthesia. It has been observed during longer operations that after a patient begins to react slightly from the effects of one or more added injections of the drug, it takes much less of the drug to restore him to the original deeper level of anesthesia than it previously required to bring him There is here an apparently significant relationship—namely, as the operation progresses. subsequent dosage becomes less frequent and much less in amount. Operations have been performed which lasted one and one-half to two and one-half hours, during which most of the drug was administered in the first half of the operation.

Second, in any operative case in which pentothal sodium is used it is always wise to have oxygen available, especially if signs of anoxia are present. Ordinarily, it may not be necessary to use oxygen for short operations, but in prolonged instances and in patients who suffer from shock from any cause, the constant administration of oxygen is important. This is particularly so when the anesthesia is maintained at a deep level for a period of time. The importance of proper oxygenation during anesthesia has already been very well established. The use of oxygen with pentothal sodium is so easily accomplished as to make the combination an ideal one for any case.

Third, it has been observed that youtliful, healthy individuals require much more anesthesia for both induction and maintenance than older, debilitated, or emaciated patients. We have also performed similar operations on apparently similar age groups and types with a wide discrepancy as to the total dosage in each case. This emphasizes the need of individualizing every case.

Fourth, immediate postoperative care consists mainly of instructing the nurse to watch the tongue carefully. Morphine, in smaller doses than usual, should be used only after the patient has reacted, to obviate any further respiratory depression. Stimulants such as coramine and picrotoxin have been used by some. These were not proved to be necessary in our experience.

The simplicity of this technic can be readily appreciated. There have been modifications suggested in which specially designed syringes, tubing, and stopcocks are used for the administration of the solution. This apparatus is superfluous. There is still some question in regard to the routine use of a  $2^{1}/_{2}$  per cent solution or a 5 per cent solution. It certainly has proved no more dangerous or difficult to give  $^{1}/_{2}$  to 1 cc. of a 5 per cent solution than 1 to 2 cc. of a  $2^{1}/_{2}$  per cent solution, and in those cases in which more than 1 Gm. is used, there is an obvious complication in the number of syringes employed. No deleterious effects have been observed in the use of a 5 per cent solution in all of our cases.

#### Comment and Discussion

Many of the conditions which formerly were supposed to preclude the use of pentothal sodium anesthesia have not proved to be contraindications in practice. Age is no bar, except in the very young where lack of cooperation and poor superficial veins are distinct handicaps. Hypertensive patients and those with poor cardiac reserve have withstood formidable major surgery with very little disturbance. No difficulty was experienced in cases where there was definite liver and renal pathology. Debilitated and aged patients tolerated this form of anesthesia very well. It seemed that in these cases, and especially in those cases suffering from shock from any cause, this anesthesia has proved to be of distinct benefit. Surgery of the throat involving the respiratory passage may present a definite mechanical hazard. Tonsillectomies have been performed, however, with no serious complications.

The postoperative recovery period in some cases has been prolonged, particularly if the dosage of the drug has exceeded the average amount required for induction and maintenance, and if the operation has been particularly prolonged. The danger of accidental asphyxia is not very great if proper precautions have been observed to maintain a patent airway, and the muscle tone has been restored about the jaw. This can be easily accomplished by the anesthetist in the operating room. In many cases of short duration the patients often react promptly at the close of the operation before they are returned to the ward. This anesthesia is highly satisfactory for the

This anesthesia is highly satisfactory for the surgeon. The simplicity and rapidity of induction is of paramount time-saving importance. The precise control of the anesthetist over the depth of anesthesia because of fractional ad-

ministration is a distinct factor for a comparably greater margin of safety. The relaxation achieved parallels that of spinal anesthesia, and in the upper abdomen is often superior to it. There is no explosive hazard. A minimum of inexpensive equipment is required, and this is easily portable under many diverse conditions. Postoperative nauses and discomfort usually attributed to general anesthesia are reduced to a minimum.

It was interesting to note that those cases which required considerable visceral manipulation showed very little postoperative shock when pentothal sodium anesthesia was used. During rather difficult surgical procedures in which visceral traction was in any way employed, there was never any evidence of vasomotor collapse. Peculiarly enough, there have been repeated instances in which patients who were suffering from severe shock, including that resulting from trauma, were markedly improved when anesthesia approached the deeper planes. This improvement was so pronounced that extensive surgery was performed with no apparent ill effects. These patients left the operating room in a much better general condition than when they entered.

From the patient's viewpoint, the anesthetic is highly gratifying. There is no fear of either the spinal needle or ether. The absence of postoperative nausea is a blessing. It was amusing to note the instances in which patients actually thought they had not been operated on, for as long as two to three days after the operation. It has become common experience to have patients request intravenous anesthesia, especially if they have had the opportunity to compare it with the other types of anesthesia.

#### Summary

Pentothal sodium is adequate for major surgery in any case in which intravenous approach is feasible. Adequate preoperative medication will markedly improve the course of anesthesia. If the dosage is adjusted to the individual needs of the patient by fractional administration, pentothal sodium oxygen anesthesia has a wide margin of safety and can be used in many cases when other types of anesthesia are definitely contraindicated. The simplicity of the technic is an extremely valuable asset in those instances in which time and equipment are necessarily limited.

### ACCEPTANCE OF BLOOD GROUPING EVIDENCE BY AMERICAN COURTS

When an American court fails to accept authentic blood test evidence it would not seem to be carrying out its responsibilities as an administrator of justice, the Journal of the American Medical Association for March 18 says in an editorial on "Blood Grouping Evidence." The Journal says:

"In courts of law any child born in lawful wedlock

is presumed to be legitimate, and from the earliest days this presumption of legitimacy has been an extremely weighty one. Under the law of the four seas' an English court once held that a child born in England was legitimate even though it appeared from the ... evidence that the husband resided in Ireland during the whole term of his wife's pregnancy and for a long time previously, because Ire-

band and wife belonged to type M, while the child belonged to type MN.) The test is now generally accepted as proof that a certain man could not have been the father of a certain child. In his decision the ludge remarked that at first he was inclined to think, albeit very reluctantly (italics ours), he was bound in law to accept the result of the blood group test, not because as a man he thought the doctor was right but because as a magistrate he thought the evidence was legally convincing. However, since the legal presumption of a child born in wedlock being legitimate is very strong, he finally decided not to upset it solely on scientific evidence. Evidently this judge preferred the comfort of adherence to tradition.

"The reaction of American courts to blood test evidence has been reviewed in a book that has just

appeared. The problem of paternity arises most frequently in so-called affiliation proceedings, less often in divorce actions. In the former the child is born out of wedlock and the mother designates a certain man as father and an action is started to compel him to support the child. In such cases, when the blood tests prove that the defendant is not the father of the child in question, the courts usually accept this result without hesitation, probably because an illegitimate child is involved. (It is highly significant that the woman usually confesses to indiscretion with other men besides the defendant after the results of the blood tests are divulged.) In uncontested divorce actions the reaction of the court is likewise favorable. In contested divorce actions, on the other hand, judges apparently prefer to accept the testimony of the wife rather than the objective blood test findings, so that in courts of this country, just as in England, not much progress has been made away from the law of the 'four seas.'

"No doubt the first duty of the court is to see that truth and justice prevail. In the English case cited, the court proudly announced the happy outcomethe husband agreed to make a home for wife and child and accept the child as his own. However, a reconciliation might have been effected without resorting to such subterfuge, because husbands in the past have been known to forgive erring wives and

to accept children not their own.

When a court refuses to dissolve or annul a marriage of two incompatible people, even though there is scientific proof of the wife's deceit or fraud, as has happened in a number of cases in American courts, the court would not appear to be carrying out its responsibilities as an administrator of justice."

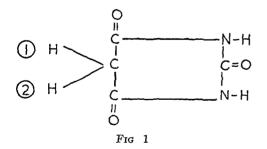

# CLINICAL STUDY OF ONE HUNDRED AND SIXTY-FIVE CASES IN WHICH SODIUM ETHALYL WAS USED AS AN HYPNOTIC AND SEDATIVE

CHARLES H. NAMMACK, M.D., and MARY FINCK, M.D., New York City

THE purpose of this study was to determine the hypnotic and sedative effects of sodium ethalyl. This product offers the combination of a quick-acting and a slow-acting drug, whose chemical structure and pharmacologic action will be discussed shortly. One hundred and sixty-five patients with varying diagnosis in the wards of the Fourth Medical Division, Bellevue Hospital, exhibiting many degrees of nervous and mental excitation, were given the drug, and its immediate, late, and later effects were studied. The results obtained will be considered in an analysis of the effects which follows. The chemical configuration and pharmacologic action will now be discussed.

# Chemical Configuration and Pharmacologic Action

Barbiturates with hypnotic properties are obtained by replacing the reactive hydrogen of barbituric acid with either aryl groups, alkyl groups, or both. The chemical formula of this parent compound is the following:

The type of aryl or alkyl groups used to replace the active hydrogen atoms (indicated by (1) and (2) in the above structure) determines very largely the degree of action obtained, its duration, the biochemical fate of the compound, and its other specific properties. In many of these compounds, the groups used to replace hydrogen (1) differ from those replacing hydrogen (2).<sup>1,2</sup>

Much of the difference in pharmacologic action between phenobarbital and pentobarbital is traceable to the difference in their chemical configurations. Compounds with branched sidechains, such as are present in pentobarbital,

Director, Fourth Medical Division, Bellevue Hospital. Resident, Fourth Medical Division, Bellevue Hospital. appear likely to manifest depressant effects of brief duration and are generally destroyed in the liver,<sup>3-7</sup> where they undergo side-chain oxidation. Their degradation products may be eliminated in the urine and have usually lost their therapeutic power.

The introduction of an aromatic group, such as is found in phenobarbital, results in a medicine which is relatively stable in the body and is eliminated in the urine. The longer period during which its action is evidenced may be associated with the time required for the elimination of the chemical by this route. This modification is also believed to be responsible for its specific anticonvulsant property in epilepsy.

Fig. 2

The graphic formulas of these two synthetic drugs are shown above.

It is worthy of note that phenobarbital contains an ethyl group as the alkyl one and a phenyl group as its aromatic function. Pentobarbital possesses two alkyl groups, ethyl and 1-methylbutyl, the latter being a branched side-chain. The variation in pharmacologic activity between these two compounds is dependent upon these functional groups.

Respiration is only slightly depressed by soporific dosage of the barbiturates and this is largely the result of sleep or sedation. They have little effect on the cardiovascular system, for although the pulse rate and blood pressure may fall, these effects are generally due to the quieting action or sleep resulting from the medication. In experimental animals it has been found that barbiturates tend to decrease the general tonus of the intestinal muscles and the amplitude of rhythmic contractions. No direct effect on normal kidney function occurs from therapeutic barbiturate medication. Large doses may, however, have an antidiuretic effect. The basal metabolic rate is usually somewhat reduced by barbiturates, but phenobarbital does not decrease the oxygen consumption. Liver function is unimpaired.2,8-12

The procedure in each case was to give the patient one capsule of sodium ethalyl, and the patient was then observed after half an hour, in two hours, in twelve hours, which was usually the following morning, and in twenty-four hours. In Table I are recorded the various observations made following the giving of the drug.

It would appear from our study that in sodium

ethalyl one has a sedative and hypnotic that is effective in producing sleep rather promptly upon the administration of one capsule, as evidenced by the figures showing approximately half the patients asleep after half an hour and 83 per cent asleep in two hours. As in most medications of this type, the individual reactions of different patients vary, and it is doubtless a fact that a small number of patients may need a larger or a repeated dose. The duration of sleep would also be determined by the underlying disease, as those suffering from pain and respiratory embarrassment, such as the cardiacs, are more likely to be wakeful than the other patients. While a number of the patients were moderately drowsy the following day, none presented any evidence of mental confusion, "hang-over," or other untoward symptoms.

# ANTS SPREAD DYSENTERY

Ants that get into the sugar bowl or other food, usually considered a harmless pest of tropical re-gions, are now incriminated as villains that probably spread dysentery, one of the disease scourges of the tropics which are a special danger to armies fighting in tropical regions.

Experiments in which ants actually did carry dysentery germs on their feet, leaving a twenty-four-hour trail of the germs wherever they walked, are reported by Dr. Sophie Deller Griffitts, of the School of Tropical Medicine at San Juan, Puerto Rico .-Science News Letter

### A SIMPLE APHASIA STUDY

HAROLD M. SOMBERG, M.D., \* New York City, and HARRINGTON V. INGHAM, Lt., (MC), AUS

DHYSICIANS confronted with a case of aphasia are often at a loss to describe their findings accurately. In addition, the maze of theoretic considerations enveloping the subject makes it difficult to interpret the results of an examination. A standard method of recording an aphasia study was developed with the hope that it would simplify some of the concepts of aphasia. The accompanying chart (Chart 1) has been found to be of use on the Neurological Service of Dr. Foster Kennedy at Bellevue Hospital. It is not within the realm of this com-

From the Neurological Service of Dr. Foster Kennedy at

Bellevue Hospital.

\* Now at the Laboratory of Physiology of the Yale University School of Medicine.

munication to discuss fully the clinical interpretations of an aphasia study. The chart is presented as an aid to a systematic recording of the multiplicity of tests comprising an adequate examination of a patient with an aphasic disorder.

First, the examiner must determine whether the patient has sufficient intelligence and education to comprehend what is required of him during the examination. Second, the handedness of the patient and his family must be known in order to determine the dominant hemisphere. The examiner should watch for the occasional right-handed individual who comes from lefthanded stock and whose dominant hemisphere is on the right, in accordance with his heredity.

The change of handedness in these cases is usually the result of early training. Third, the status of the primary sensory and motor pathways of the patient must also be known. Errors such as testing for visual recognition of a symbol in a patient with cataracts may thus be avoided.

The chart is divided into two broad fields: perception and motor functions. The sensory part of the examination is divided into three sections: (1) hearing, (2) vision, and (3) touch. The function of these modalities is tested in each of the three levels of sensation necessary for the complete interpretation of environment. simple example is the response to the ringing of an air-raid siren. The first level, perception, is one in which the patient appreciates a ringing noise. The second level, cognizance, is one in which the patient recognizes the noise as the ringing of the siren. The third level, conation, is one in which the patient appreciates the necessity of running for shelter, having recognized the sound of a siren as evidence of approaching danger.

The localization in the brain of each of these levels is not entirely known. The centers of perception are thought to be in clearly defined areas. The centers of cognizance are more diffuse but still are localizable. However, the conative functions are diffusely represented throughout the cortex. It is known that a lesion of the transverse temporal gyrus of the dominant hemisphere produces a defect in the perception of sound, whereas one in the posterior part of the first and second temporal gyri of the dominant hemisphere causes a defect in the cognitive level of hearing. Defects in the conative level may be produced by lesions in many areas. In the visual modality, defects in the perceptive level are produced by lesions in the calcarine area, while defects of the cognitive level are caused by lesions of the angular gyrus. The perceptive level of the third sensory modality, touch, is represented in the postcentral gyrus; however, lesions posterior to this area produce defects in the higher levels for touch.

Studies of motor aphasia reveal that there are three principal pathways of expression: (1) speech, (2) writing, and (3) motor activity of a definite motor pattern. The patient is tested for his ability to use each of these motor modalities in a simple test. Then the patient is tested for his ability to duplicate speech and writing, following both verbal and written examples. These represent a higher level of function. In testing the performance of a motor pattern, the patient follows verbal instructions as well as mimicking acts performed by the examiner.

The cortical localizations for the motor modalities are not so well known as those for the sensory functions. As a generalization, lesions of the region of the second and third frontal gyriaffect verbalization as well as the other forms of language, including reading and writing. It is known that motor performance is controlled by the precentral gyrus. However, the localization for the higher levels involving mimicking is not known. The mathematical and musical tests are included because striking defects in these spheres are occasionally encountered. Each of these is represented in an isolated area of the dominant temporal lobe.

Every competent neurologist will agree that while an aphasia study may be of practical significance in only a limited number of cases further elucidation of the problem is necessary as a complement to study of cerebral function. We believe that, although this chart will not satisfy the need for basic investigation in the problems of aphasia, it does provide a simple standard means of recording the responses of an aphasic patient.

### NEW MOTION PICTURE ON PREVENTION OF BLINDNESS

An addition to the growing number of motion pictures in the field of health education is "Eyes for Tomorrow," a two-reel film, produced by the Emerson Yorke Studio for the National Society for the Prevention of Blindness, 1790 Broadway, New York City. Alois Hayrilla is the commentator for the picture

the picture.

"Eyes for Tomorrow" stresses good general health as a prerequisite for good eyesight. It also deals with the importance of prenatal care as a means of reducing the amount of blindness caused by syphilis and gonorrhea; the conservation of vision among school children; the use of sight-sav-

ing classes for children with seriously defective vision; the necessity for regular eye examinations; methods of treating glaucoma and trachoma; and the eye hazards of industry.

The film, in 16 and 35 mm., will be distributed in the United States by the National Society for the Prevention of Blindness. Prints in 16 mm. are offered for sale at \$50, or rental at \$5.00 per day, exclusive of time in transit. A slightly altered version, with Spanish and Portuguese sound tracks, will be released throughout Latin America under auspices of the Office of the Coordinator of Inter-American Affairs.

### Case Report

### UNUSUAL CONTACTS IN EARLY SYPHILIS

Report of a Case of Extragenital Chancre on the Chest and a Case of Lymphogenous Syphilis d'Emblée

JOHN GARB, M.D., New York City

I AM herein reporting two cases of unusual contact in early syphilis. There are also other interesting features worthy of comment.

Case 1.—L. X., a white woman aged 41, came to the office on December 30, 1943, complaining of a growth on the chest of six weeks' duration. She gave a history of having had a benign tumor removed from the right breast in 1934 and a pelvic tumor removed in 1936. Her family physician treated her for a few weeks with topical remedies. He considered later the diagnosis of malignancy. A blood test was not done.

Just above the left nipple was a well-defined, painless, ulcerated growth. It was quadrangular, 1.5 cm. in diameter, flattened, and raised about 2 mm. There was a generalized macular rash which the patient did not consider to be of serious import. Darkfield examination of the nodule did not disclose Spirochaeta pallida. There were no erosions

on the labial and cervical mucosae.

I questioned her as to the probable source of infection. She stated that she gave practical nursing care to her brother, E. X., a sailor, who had a "rash and sores." She was quite certain, after I told her the nature of her disease, that her brother's rash was syphilitic. The patient felt convinced that she became infected through his soiled dressings. She denied that her brother kissed her on the chest.

Two blood samples were taken and sent to two laboratories. Laboratory A reported 4 plus Kline and Wassermann reactions. Laboratory B reported only a 1 plus Wassermann reaction. Two other blood specimens examined by Laboratory B a few days later under two different names gave 4

plus Wassermann reactions.

The sailor lived with a married sister who had two boys, four and six years of age, whom he had

been kissing frequently on the cheeks.

Case 2.—J. X., the father of these children, was seen by me on February 3, 1943. He complained of being restless, irritable, and depressed. He had been having a slight fever and an enlarged lymph node under his left armpit for ten days. His physician attributed the enlargement of the lymph node to a "strained muscle" and prescribed antiphlogistin. Examination revealed a generalized macular rash and a large cherry-sized growth in the left axilla. There was no evidence of a primary lesion on the hands. He had a reddened throat and a temperature of 101 F.

I informed the patient that his rash was undoubtedly syphilitic but that it should be corroborated by the finding of Spirochaeta pallida in the lymph node or by a positive Wassermann reaction. I questioned him at length about the manner of his infection. He stated that three weeks prior to the appearance of the lymph node he had a fist fight with his brother-in-law, the sailor, with resultant injury

and bleeding of the sailor's lower lip.

I injected a few drops of sterile physiologic saline

solution in the axillary lymph node and then reaspirated it from the lymph node tissue. Search for Spirochaeta pallida by darkfield illumination was unsuccessful. The Wassermann and Kline tests were strongly positive. Two days after the injection of bismuth subsalicylate (1 cc. containing 0.13 Gm. of bismuth subsalicylate) the lymph node regressed to about half its former size. On February 14 the patient developed a paralysis of the left facial nerve. He was unable to blink or smile. The lips were pulled over to the left side. The paralysis responded readily to antisyphilitic therapy, recovery taking place within one week.

paralysis responded readily to antisyphilitic therapy, recovery taking place within one week.

Case S.—E. X., the sailor, came to see me on February 12, as soon as he landed. He gave the following history. "On October 10, 1942, I noticed a tiny sore on my chin. After one week it became hard and raised. It was painless. A physician in New York gave me a salve. A blood test was not taken. A week later a rash appeared on the body. There was no itching. I later saw five doctors in Casablanca. They wanted a blood test to be taken but would not commit themselves to a

diagnosis."

On his chin was a dime-sized, slightly raised, ulcerated plaque. A hard, painless lymph node the size of a cherry was palpable in the submental region. There were fissures and ulcerations in the corners of the mouth. The teeth were decayed and many were missing. He had a mild laryngitis. There was a profuse generalized maculopapular rash with palmar lesions, masked in many areas on the lower half of the trunk by ill-defined patches of dermatitis. Darkfield examination of the serum obtained by scraping the squamous papules disclosed Spirochaeta pallida. The blood showed a 4 plus Wassermann but a negative Kline reaction. The patient was hospitalized at the U. S. Marine Hospital for treatment. The Wassermann test was repeated and reported to be strongly positive. The Kline test was not done.

The Kline test was not done.

Histologic Section: A papule excised from the left forearm was examined by Dr. Wilbert Sachs.

He described it as follows:

"Most of the vessels throughout the entire cutis are involved. About these is a tremendous local cellular infiltration. Some vessels are dilated and some are almost occluded. The walls are thickened. For the most part the intima is swollen and the endothelial lining projects into the lumen. The cellular infiltration, plasma cells, collarettes, are all features

infiltration, plasma cells, collarettes, are all features of secondary syphilis."

Case 4.—D. X., the younger child of J. X., showed on March 8 signs of acute infection. He had a temperature of 101 F. and a mucopurulent nasal discharge. The tonsils were acutely inflamed and hypertrophied, especially the left. I scraped off the scaly papules and made a darkfield examination of the exuding scrum but found no Spirochaeta pallida. The family objected to a puncture of the

cervical lymph node.

A week later the child developed an upper respiratory infection. A blood specimen taken at that time and examined in Laboratory A gave a 3 plus Wassermann and a 2 plus Kline reaction. The Wassermann, Kline, and Mazzini tests done by Laboratory B on the same serum were negative. The child was placed under the care of his family physician, who prescribed sulfanilamide tablets. Subsequent physical examination did not reveal any evidence of a syphilitic infection. Several blood tests taken since have been negative.

#### Comment

The sailor infected his sister and brother-in-law-He probably infected his sister, L. X., through the soiled dressings or through droplet material in coughing or spitting. Dressings with moist discharges are extremely dangerous. <sup>12</sup> Droplet material from coughing or spitting constitutes a real danger. <sup>15</sup>

J. X., his brother-in-law, did not show any evidence of a primary lesion on the hands. He denied the presence of a lesion which might have been an extragenital chancre on the hand. The source of entry was most likely an abrasion on the left hand, as evidenced by the large lymph node in the left axilla. This lymph node could properly be called bubon d'emblée of the lymphogenous type. Stokes tates that "It is a fact that while the appearance of the chancre at the site of inoculation is the usual expected sequel of the entry of the organism, there is much to suppose that the primary reaction may be absent and inoculation show its first signs not at the point of traumatic entry but in the adjacent lymphatics (bubon d'emblée)."

Facial nerve paralysis, of which this patient complained, is a fairly uncommon complication. It constitutes about 1 per cent of the symptomatology in early syphilis.<sup>14</sup> This type differs from the facial paralysis of other causes by its prompt re-

sponse to antisyphilitic therapy.

The children and the remaining members of the family have luckily escaped the disease. But there may have been others infected by the sailor during the three months of his untreated virulent syphilitic infection. The physicians in New York and in Casablanca apparently failed in the diagnosis although the "sore" should have been recognized as an extragenital chancre occurring frequently enough on the upper lip. It should certainly have been readily diagnosed by the physicians in Casablanca when there was subjective and objective evidence of primary and secondary syphilis.

The doctor might easily be excused in failing to diagnose the chancre in the sister because of the unusual location, above the left nipple. The history of the removal of a tumor from the left breast in 1934 had apparently taken him off guard and influenced him in considering the diagnosis of malignancy. The presence of the large lymph node in J. X. in the absence of a typical primary sore might easily mislead many physicians. A careful examination, however, might have already revealed a typical eruption of secondary syphilis and a routine blood test might then have given a positive Wassermann reaction.

These cases illustrate the fact that practitioners fail frequently to recognize extragenital chancres, especially those that are atypical. Stokes1e states that "A lesion on the genitalia may arouse some suspicion a priori, but a lesion on the finger, lip, or tonsil seldom does. Syphilis seems to be suggested last to the examiner, instead of first, of all the existing possibilities. As long as this state of mind exists the recognition and proper appraisal of extragenital onset in this disease will be anything but complete." In a multiple extragenital infection in five members of a family reported by Rowntree and Hendon<sup>2</sup> two syphilitic lesions were not recognized by a physician. The diagnosis of trench mouth was made for a tonsillar infection and impetigo for a chancre of the lower lip.

The following suggestions are, therefore, offered as essential and imperative prerequisites for combating syphilis. It should be mandatory for practitioners to take short courses in syphilology in a skin and syphilis clinic. These courses should be repeated at five-year intervals. While a course of four to six weeks would be inadequate for learning all the aspects of syphilology, it would at least lead the doctor to regard any suspicious lesion as possibly syphilitic until ruled out by clinical and laboratory

data.

Stress should be placed on the necessity of a complete physical examination in any cutaneous manifestation, especially when the diagnosis is in doubt. The age of the patient should not in any way deter the physician from considering the possibility of early syphilis. This is well exemplified by the following case:

Case 5.—C. J., a man aged 81, registered at the New York Skin and Cancer Unit on October 29, 1943, presenting a rash of three weeks' duration on the left forearm. Examination of the trunk showed a painless, large, pea-sized indurated erosion on the prepuce. He had a generalized fine macular rash. The blood test was strongly positive. This patient, less carefully examined, would have been quickly discharged with a diagnosis of a mild dermattis, as the rash on the forearm which he presented appeared to be of a nondescript nature.

Routine blood Wassermann tests should be done on every new patient in a doctor's office and in the clinic. Many early and latent syphilitic patients would thus be discovered.

The public should be systematically warned of the danger of infection by kissing, especially by one having a rash or sore. Kissing, beside transmitting other infectious diseases, constitutes the overwhelmingly predominant mode of transmitting syphilis extragenitally.3a Spirochaeta pallida have been found in the saliva.3b In a famous incident reported by Schamberg3c seven young women developed syphilitic lesions following a kissing game in which a young man with a chancre of the lip participated. One of these girls later infected another young man by kissing. In Rowntree and Hendon's2 report a baby aged 18 months and a girl of 11 developed chancres on the lower lip, a boy aged 6 years had a fissured encrusted lesion on the pinna of the left ear, and a girl aged 17 had a lesion

inside the lower lip. The latter was infected by her brother, aged 19, who had a lesion on the right tonsil.

Laboratory B made an error in the first blood test of L. X., reporting a 1 plus instead of a 4 plus Wassermann reaction, and Laboratory A wrongly reported a 3 plus Wassermann reaction on the blood specimen of the child D. X., as the same serum examined by Laboratory B was found negative. This shows clearly the necessity for examination of the blood, especially in cases of suspected early syphilis, by two reliable laboratories to avoid confusion, false diagnosis, and delay in treatment. It would have been wrong to treat L. X. for syphilis on the 1 plus Wassermann report of Laboratory B. even though the clinical manifestations were those of a typical case of early syphilis. Neither should one rely upon one positive blood test report in the absence of a syphilitic rash and a negative darkfield, even though the history and some clinical manifestations point to a syphilitic infection. Had I relied on the 3 plus report of Laboratory A, which seemed to substantiate the clinical evidence of a probable syphilitic infection (history of exposure by kissing to the same source of infection as his father and aunt, malaise, mucopurulent discharge, acute tonsillitis, large submaxillary lymph node, and maculopapular rash on the sole of the right foot), the child D. X. would have been stigmatized as a syphilitic and subjected to unnecessary and prolonged treatment with potent drugs. Laboratory A apparently erred in the 3 plus Wassermann report of this child, as the same serum examined by Laboratory B was negative. Subsequent examinations and blood tests definitely ruled out a syphilitic infection.

Even if the 3 plus Wassermann report had been correct, it could have signified a false positive reaction occasionally occurring in infants and children4 with upper respiratory infection.

E. X., the sailor, gave a 4 plus Wassermann but a negative Kline reaction. This may occasionally occur in a patient with early syphilis whose serum gives a positive reaction with the Kolmer-Wassermann test and negative reactions with all flocculation tests, including the Kahn and the Kline. The Kline test or any other single-celled microflocculation procedure could give a false negative zone reaction<sup>5</sup> with a high-titered serum. Such a

serum should be diluted with normal saline solution. The test may become positive in higher dilutions.

### Summary

Two cases in one family are reported, one with an extragenital chancre on the breast and one with bubon d'emblée, both contracted from a third member of the family.

These two cases, like many others with extragenital chancres, were not recognized by the practitioner, while the chancre of the lip of the sailor who infected them was not diagnosed by several physicians.

The blood examination of the sailor gave a 4 plus Wassermann but a negative Kline reaction. This may occur occasionally with a high-titered serum. Such a serum may become positive in a high dilution with normal saline solution.

A suggestion is offered that practitioners take courses in syphilology to make them so syphilis conscious that they think of syphilis first rather than last in any case of questionable diagnosis.

More careful and complete examination is urged in all cases. Routine blood Wassermann tests should be done on every new patient in the clinic and private practice, thus helping to discover cases of syphilis that are frequently overlooked in a cursory examination.

Systematic education should be given to the public, warning of the danger of infection by kissing.

Blood tests in early syphilis should be sent to two reliable laboratories to avoid error, such as was made in the case of a 4-year-old child who had all the earmarks of an early syphilitic infection, including a 3 plus Wassermann report. The same serum was found to be negative by another laboratory. Subsequent physical and laboratory examinations proved the infection to be of a nonsyphilitic nature.

### Sunshine and the Food Value of Plants

When the housewife goes to market to buy greens for her family she assumes that spinach is spinach regardless of variety, age, conditions of growth, and time of harvesting. She takes for granted that a pound of spinach or chard obtainable on one day is equal in quality to a pound on any other day, regardless of time and weather conditions. In the feeding of animals the farmer even assumes that two hours' pasturing of his stock in the early morning is equivalent to two hours in the late after-

Actually, these assumptions do not agree with the facts. Definite differences in the amount of starches, sugars, proteins, fats, minerals, and of vitamins as well may be found in plants subjected to different weather conditions, especially at and near the time of harvesting, or even in plants picked at different times of day. Differences, which are particularly noticeable in the leaves, may be found also in plants

of different ages.

To increase our knowledge of one of the vitamins, namely, vitamin C, studies were made to determine the effect of age, conditions for growth, and time of harvesting upon the quantity of this substance in tdible plants. It was assumed that the amount of food in a pound of spinach or peas might depend upon how old the plants were when the vegetables were picked, on the age of the vegetables themselves, on the time of day when they were picked, and on whether the weather had been prevailingly cloudy or sunny during their growth, particularly around the time of harvesting. It was found that light has a remarkable effect upon the accumulation of vitamin C. Seedlings sprouted in light contained, after seven days, more than four times as much vitamin C as seedlings of the same age grown in darkness. Plants grown in the greenhouse during May and June in the neighborhood of Washington, D.C., contained twice as much vitamin C as plants grown during December and January. In more northerly latitudes it might be expected that the differences at the two seasons would be even greater. However, recent tests with tomatoes conducted at the U.S. Department of Agriculture's Regional Laboratory at Ithaca, New York, yielded differences in Vitamin Contact that the contact winter months. vitamin C values in the summer and winter months similar to those which had been found with other types of plants at Washington, D.C.

Fruit from the shaded side of a tree has been shown by other workers to have a lower vitamin C content than that from the sunny side, and even in individual fruits the sunny side has been found to have more than the shaded side. The changes in the amount of vitamin C in a plant under varying conditions of sunlight are noticed first in the leaves, though later differences may be observed in other

parts, even in the roots.

Losses of vitamin Cat night amounting to as much as 20 per cent of the total quantity, and possibly even more, may occur in some types of plants. Appreciable losses at night occur only when the temperature is high enough to allow growth to take place. Similar losses of the vitamin may occur also during the day but the quantity thus lost is not readily measurable because the vitamin is manufactured more rapidly than it is used. So the net result is an increase in vitamin C. Manufacture at a slow rate occurs at night, but its magnitude is difficult to describe the control of t termine because the vitamin is lost much more quickly than it is made. These facts suggest that vitamin C is used by the plant in the process of growth. Just what it does with the vitamin is so far a secret with the plant. The evidence suggests, however, that it is used for some purpose in the growing regions such as in the tips of the roots and stems and in the development of the young leaves.

As a consequence of its own life processes, therefore, a plant starts the day with a lowered amount of vitamin C. If there then follows a succession of very cloudy days, and if the plant is growing rapidly, there tends to be a slow but progressive lowering of the amount of vitamin C. Comparable losses in the sugars and starches of plants under similar conditions have been recognized for a long time. Then comes a bright, sunshiny day. Marked gains in the vitamin are to be observed during the course of the day. Some types of plants may, under these conditions, have more than 25 per cent

more vitamin C by late afternoon than at break of

An interesting example of this variation in nutriitonal value of plants as related to time of day turned up in an experience in silkworm feeding. In sections of Italy where silkworm production has been an important industry from ancient times, it has been the practice to gather the mulberry leaves, used in feeding the worms, at dusk. These sericulturists have found by experience that leaves gathered at the end of the day tend to yield better results than leaves collected in the morning. Chemical studies of mulberry leaves have revealed why this is true. During the day, under the influence of sunlight, the leaves become enriched in nutritive substances, not only with carbohydrates such as starches and sugars but also with proteins, fats, minerals, and presumably vitamins, too, since vitamin C, for example, is known to be present in relatively high concentrations in mulberry leaves. Moreover, the protein of young mulberry leaves nearing full size has been found to be superior in quality, quantity, and digestibility to that in well-matured leaves.....

Just as in mulberry leaves, a greater amount of

starches and sugars is found in plants kept in sunlight than in those kept in shade, and more also in plants collected in the evening than in those collected in the morning; but nothing was known until recently of the effect of variations in these different conditions on the amounts of any of the vita-

mins.

It remains to be seen whether the amounts of the other vitamins in fruits and vegetables vary as does vitamin C with differences in light intensity, length of day, and time of day for harvesting. It seems probable that if differences occur they won't be so great as those of vitamin C, unless the vitamin in question, like vitamin C, is also used up in the life processes of the plant. .

Present results suggest that for good vitamin C values the harvesting of vegetables should not be done before mid-forenoon, say, 10 o'clock, after generally clear weather. It is preferable to harvest, if possible, after a spell of clear weather, or, if it must be done following cloudy days, collection should be made late in the day. Because of the tendency of vegetables, especially those of leafy type, to lose vitamin C on standing, when weather conditions permit, vegetables from the home garden should be freshly picked each day.

Particularly now, because of the war emergency, all available methods for the procurement of high vitamin values in foods should be utilized to the full-

est extent practicable. The dehydration of foods . . . . involves considerable loss in vitamin content, particularly vitamin C. It is well known, too, that some loss of vitamins usually occurs in the cooking and canning of foods. Rather extensive destruction of vitamins may take place also during the shipment, storage and marketing of fresh foods, some of which could and undoubtedly will be lessened by improvement in methods of treatment. It is probably inevitable, however, even under the best of

conditions, that comparatively large losses of vitamins will continue to occur in the handling, storage and cooking, or processing of foodstuffs. Therefore, in order to ensure each individual an adequate daily quota of these essential substances it becomes important that everything possible be done to provide both the processor and the housewife with foods having high original vitamin values.—Mary Elizabeth Reid, U.S. Public Health Service, in the Journal of the New York Botanical Garden

### GALEN (A.D. 131-201)

For Rome Galen was an episode; for the Middle Ages anepoch.—Meyer

For fifteen centuries Galen, the greatest of the Greek physicians after Hippocrates, dominated the entire field of medicine with no challenge to his authority; his theories were accepted as facts and his systems transmitted as law. How one man could acquire such stature and remain in so lofty a position for over a thousand years is the most amazing phenomenon in the annals of medical history.

This remarkable man was born in Pergamos, Asia Minor (A.D. 131), the son of an architect. He studied medicine in Greece and Alexandria and eventually practiced in Rome. Here he achieved a wide reputation, and at the time of his death (A.D. 201) was the recognized leader of the profession. After his death the science of medicine suffered a

gradual decline until the Renaissance.

Galen, a professed disciple of Hippocrates, firmly believed in direct observation and experiment. Although, because of the existing prejudice, he had no opportunity for dissecting human bodies, he did carry out experiments and dissections on most of the available species of animals. He was a voluminous writer, and his works, which are a gigantic encyclopedia of the time, include books on anatomy, physiology, pathology, therapeutics, and pharmacy. He was an extreme egotist and constantly "blew his own horn." While his writings contain numerous records of his miraculous cures, they contain no clear accounts of his cases. In spite of numerous faulty conceptions, such as his ideas that there are "pores" in the interventricular septum and that the uterus is double, he made many fundamental discoveries and deserves the title "the founder of experimental physiology." He was the first to describe the cranial nerves and the sympathetic system; he made the first experimental sections of the

spinal cord, producing hemiplegia; he produce aphonia by cutting the recurrent laryngeal nerve he gave the first valid explanation of the mechani of respiration; and he showed that the arteries co tain blood and that the excised heart will beat ou side the body. His excellent experimental work wa spoiled, however, by his involved theories which paradoxically, made him the undisputed medic authority for fifteen centuries.

Galen attempted to fit everything into one gran scheme, with an answer for every problem and reason for every phenomenon. He believed the Nature had created every part of the organism for specific purpose and that the perfect relation be tween the function of an organ and its pre-estab lished purpose merely proved the omniscience o God. For Galen the body was but the instrument o the soul. Thus his system, which corresponded in its essential features to Christian dogma and at the same time to the monotheistic systems of the Arab and Hebrews, was quickly taken up by the Church and also cherished by the Arabic and Hebrew phy sicians. His position, therefore, remained unassail able for centuries, since those who questioned the truth of his statements were treated as heretics Through the dark years of the Middle Ages Galen's brilliant researches lay sterile, while scholars "mistook the symbol for the thing" and wasted themselves in vain discussions of philosophy and dogma. However, we should not be too quick to condemn the medieval mind, for today we have only to look about to see how readily students are attracted to dogmatic Although in this modern scientific age teaching. Galenism is considered dead, in Persia and Syria Galen's writings are still held in great respect and we ourselves often are only a short step from medievalism .- J. C. T., in Thumbnail Sketches of Eminent Physicians, North Carolina M. J., Feb., 1944

### ARMY ARTISTS AT FRONT PICTURE LATEST SURGERY

A medical history of the war, recording in photographs and drawings new surgical technic and unusual treatment of disease, is being prepared in the European theater by soldier artists, members of the Museum and Medical Arts Service of the Medical Corps, the War Department announces.

Drawings of a rare eye disease, coloboma, involving a growth in the interior of the eyeball, were made by Sgt. Clifton B. Potter, of Beverly, Massa-

chusetts.

"I climbed into a sterile gown and stood by the surgeon and looked over his shoulder," Potter said. "I didn't actually draw in the operating room, but took quick mental notes and transposed them later

into sketches. These were enlarged into pictures of

each step of the operation."
Sgt. Joseph G. Nalopovic, of Silver Springs Maryland, recently photographed a simplified method of applying plaster casts in the field, making twelve pictures of various stages.

Capt. Ralph D. Reed, of Bethesda, Maryland, for-merly bacteriologist with the United States Public Health Service, with the aid of three photographers and two medical artists, set up an "art gallery" and darkroom.

He and his staff took motion pictures of any operation or treatment valuable for future study by Army doctors.

### NORTON AWARD FOR BOOKS ON MEDICINE AND THE MEDICAL PROFESSION

W. W. Norton and Company, New York City publishers, are offering the Norton Award of \$3,500, to encourage the writing of books on medicine and the medical profession for the layman.

Books in several categories are eligible: accounts of scientific research supplying firsthand, dependable information on new medical developments; autobiographies and accounts of personal experiences in the medical field; histories of any aspect of medicine or biographies of medical figures; theoretical works on scientific or social aspects of medicine. The book for which the award is made will be published in 1945; manuscripts must be delivered to the publisher by December 31, 1944.

A candidate must be a professional worker in the

field of medicine or must be a collaborator with such a worker. The manuscript should be addressed to the layman and would preferably be 60,000–175,000 words in length, although there is no restriction in this qualification.

Burma Surgeon by Gordon Seagrave, The Wisdom of the Body by Walter B. Cannon, and An American Doctor's Odyssey by Victor Heiser are some of the books on medicine and the medical profession published by Norton.

The entry form which must accompany each manuscript, the Norton Manual of Style, and further information may be obtained on request from W. W. Norton and Company, Inc., 70 Fifth Avenue, New York 11, New York.

### Postgraduate Medical Education

Programs arranged by the Council Committee on Public Health and Education of the Medical Society of the State of New York are published in this section of the JOURNAL. The members of the committee are Oliver W. H. Mitchell, M.D., Chairman (428 Greenwood Place, Syracuse); George Baehr, M.D., and Chorles D. Post, M.D.

### Six Lectures for Sullivan County

A SERIES of meetings to provide postgraduate instruction in general medicine has been arranged for the Medical Society of the County of Sullivan, to be held on Wednesdays at 8:00 p.m.

Sullivan, to be held on Wednesdays at 8:00 p.m.

The first meeting will take place on May 17 at the Lenape Hotel, Liberty. A lecture entitled "The Early Treatment of Poliomyelitis, with a Description and Evaluation of the Kenny Technics" will be delivered by Dr. Philip M. Stimson, associate professor of clinical pediatrics at Cornell University Medical College. This will be the society's semi-annual meeting. On May 24 Dr. Donovan J. McCune, of the Babies Hospital, New York City, and associate professor of pediatrics at the College of Physicians and Surgeons, Columbia University, will speak on "Deficiency Diseases" at Monticello Hospital, Monticello.

The third meeting will be held at the Woodbourne Institution for Mental Delinquents, Woodbourne, on June 7. "Headache" will be the topic discussed by Dr. Harold G. Wolff, associate professor of medicine at Cornell University Medical College. On June 14, at the Workmen's Circle Sanatorium,

Liberty, Dr. Ralph G. Stillman, assistant professor of medicine (clinical pathology) at Cornell University Medical College, will speak on the subject, "The Significance of Laboratory Tests and Methods in the Practice of Medicine."

On June 21 Dr. Joseph J. Bunim, assistant professor of clinical medicine at New York University College of Medicine, will deliver a lecture called "Newer Chemotherapeutic Methods." This meeting will be held at the Lenape Hotel in Liberty.

ing will be held at the Lenape Hotel in Liberty.

The last meeting will be held on June 28 at Monticello Hospital, Monticello. "The Relation of Vitamins to Disease" will be the lecture; the speaker will be Dr. Norman Jolliffe, associate professor of medicine at New York University College of Medicine.

This instruction is provided by the Medical Society of the State of New York, except for the lectures on poliomyelitis, deficiency diseases, newer chemotherapeutic methods, and the relation of vitamins to disease, which are provided jointly by the Medical Society of the State of New York and the New York State Department of Health.

### THE FATIGUE LABORATORY

The Fatigue Laboratory of the Harvard School of Business Administration was the result, more or less directly, of the wisdom and foresight of Dean Wallace B. Donham, who, during his term of office, appreciated the possibilities of research into the conditions with which industry is concerned. The laboratory was accordingly set up, in 1928, under the auspices of the Rockefeller Foundation, and continues to function with the aid of the National Research Council.

The late Prof. Lawrence J. Henderson directed the establishment of the laboratory and was its wisest counselor, under the successive directorships of Dr. Arlie V. Bock and Dr. D. B. Dill. Lieutenant Colonel Dill continues his interest during the present activities of the laboratory, but the active directorship has passed back into the hands of Dr. Bock for the duration of the emergency, with the practical functioning of the laboratory in the hands of Drs. R. C. Darling, W. H. Forbes, and Robert E. Johnson

Except for a small flame of pure research that is kept burning at the laboratory until better days for academic pursuits have returned, the work that is being conducted is done entirely for the Office of Scientific Research and Development and for the Quartermaster Corps of the Army. Thus, in the cold room, with a minimum temperature of -40 F., various types of warm clothing, including electrically heated suits and shoes, are tested on the living subject; here also, stiffly recumbent, lies "Oscar," the electric dummy, within whose patient frame is

measured the amount of current required to keep his body temperature up to a human normal with the aid of various styles and types of garments. In another chamber tropical heat and humidity are attained, and here experiments are conducted on heat exhaustion and acclimatization, and the best types of clothing for these climatic conditions, with a three-and-a-half-mile-an-hour march simulated on an electric treadmill. Still another chamber furnishes the atmospheric pressures of various altitudes.

Nutrition studies based on the standard field rations are being conducted, with a view to their balance, particularly regarding the vitamin B fractions; studies have been made under field working conditions on the protein requirements of the body, and it has been found that good health and nutrition can be maintained on a protein intake considerably below the traditionally accepted 70 Gm. per day, with those that are provided being principally from vegetable sources.

In addition to its homework, the laboratory is constantly on call to send its investigators into the field wherever needed, to make their studies under actual living and working conditions. Its official reports run into volumes, and when, finally, the veil of secrecy can be lifted, it will be found that scientific progress has taken some tremendous steps in various directions during the war years.

in various directions during the war years.

Indefinite and inclusive as the term "fatigue".
may be, the Fatigue Laboratory has long since outgrown its title.—Editorial in New England M. J.,

Dec. 30, 1943

### Medical News

### Lahey Reports on Relocation of Physicians

BETWEEN January, 1942, and the end of February this year the War Manpower Commission has managed to relocate 2,955 physicians to areas where their private practice is more acutely needed, the agency announced on April 22.

Dr. Frank H. Lahey, chairman of WMC's Procurement and Assignment Service, estimated that perhaps 250 more physicians were enabled to obtain

new locations in March.

The procurement service has the cooperation of the United States Public Health Service in its program to assist local communities in the relocation of physicians. Under a recent law the United States Public Health Service may pay a subsistence allowance of \$250 a month for three months to a physician being relocated, plus transportation expenses, provided the local community pays one-fourth of the total cost.

'Although the allocation of physicians between the armed forces and the civilian population effected by the Procurement and Assignment Service has resulted in an over-all equitable withdrawal of physicians for military service, serious medical care problems exist in many sections of the country as a whole," Dr. Lahey said. "Since 1942, through March 31, 1944, State Chairmen of the Procurement and Assignment Service have reported 510 areas as being critically short of medical personnel.

"Of these areas the needs for medical personnel were met in 281 communities, or 55 per cent of the critical areas. Relocations were effected in 135 of these communities and the needs of 146 were met

by other means."

Dr. Lahey explained that among the methods included in the phrase "by other means" were inducing retired physicians to resume active practice, changes in types of medical practice, and "freezing" of medical personnel in civilian communities by Procurement and Assignment Service classification as "essential."

The needs of 185 communities have not yet been

The needs of 185 communities have not yet been met, he said, and reports have not been received from 44 communities on the steps that they have

taken.

### Baruch Gives \$1,100000, for Physical Medicine

BERNARD M. BARUCH, of New York City, has announced a donation of \$1,100,000 in cash of his personal fortune for a ten-year program in the study and teaching of physical therapy—a field in which he inherited a life-long interest from his father, the late Dr. Simon Baruch.

The seventy-three-year-old financier, who is special adviser to James E. Byrnes, director of the Office of War Mobilization, said he would put most of his fortune into the project if it is successful, and explained that he was moved to give the money at this time because of the increasing importance of physical therapy in the care of war wounded.

Mr. Baruch said the funds would be distributed as follows: Columbia University College of Physicians and Surgeons—\$400,000; New York University College of Medicine—\$250,000; Medical College of Virginia—\$250,000; selected medical

schools not yet announced—\$100,000; for fellow-ships and residencies—\$100,000.

The Baruch plan, which is based on recommendations made by a committee of scientists and medical men headed by Dr. Ray Lyman Wilbur, chancellor of Stanford University, has the primary aim of multiplying by at least five times the present 2,700

physical therapy specialists.

Mr. Baruch's grant will be administered by a board of three, directed by Dr. Frank H. Krusen, professor of physical therapy at the University of Minnesota and head of the section on physical therapy at the Mayo Clinic. Dr. Wilbur will be chairman of the committee and its third member is Miss Mary Boyle, an assistant to Mr. Baruch for the last thirty-five years. Headquarters of the board will be at 597 Madison Avenue, New York City.

### Jewish Tuberculosis Group Marks Thirtieth Anniversary

THE thirtieth anniversary of the Committee for the Care of the Jewish Tuberculous, Inc., was elebrated on April 27 by a dinner at the Waldorf-Astoria Hotel in New York City. Dr. David R. Lyman, medical director of Gaylord Farms Sanatorium, Dr. Louis I. Dublin, vice-president of the Metropolitan Life Insurance Company, and Fred M. Stein, president of the Committee, spoke.

The central theme of the talks was rehabilitation.

The central theme of the talks was rehabilitation. Edward Hochhauser, executive director of the organization, said: "The story of our experience in

the rehabilitation of the tuberculous has particular significance not only for the tuberculous but also for other war and civilian disabled."

A message from President Roosevelt, praising

the work of the Committee, was read.

Although now an independent organization, affiliated with the Federation for the Support of Jewish Philanthropic Societies, the Committee for the Care of the Jewish Tuberculous was founded in December, 1913, as a unit of three established agencies.

### New Cancer Book by Dr. Little

THE eagerly anticipated handbook, Cancer—A Study for Laymen, on which Dr. Clarence C. Little, managing director of the American Society for the Control of Cancer, has been working for many months, will soon be en route to each state headquarters of the Women's Field Army. It has

been printed for free distribution through the generosity of an anonymous donor. It is not for sale. A total of 9,000 copies are to be sent to the states so that every worker, down through and including county captains, will receive this real contribution to the work of the Women's Field Army.

It is a book of reference which contains a brief review for the intelligent and interested layman of the more important knowledge concerning can-

There are three main subdivisions. The first deals with facts pertinent to cancer research and to an understanding of the nature of the disease. second deals with diagnosis and treatment. third covers the field of cancer education.

The particular group to which the book is addressed is the officers of the Women's Field Army. Those outside of the Field Army will find in the text perhaps a personal emphasis which they may not understand unless they keep in mind that the text is partly in the nature of advice and instruction to people who have a particular responsibility and are actively engaged in cancer control work.—Women's Field Army News, April, 1944

### County News

### Albany County

The Albany County Medical Society met in the auditorium of the Albany College of Pharmacy on April 26. Dr. William Dameshek, of Boston, professor of clinical medicine at Tufts College Medical School and a member of the faculty of Wartime Post-graduate Instruction, spoke on "The Practice of Hematology." Discussion of the paper was opened by Drs. James Rooney, James Bucci, and Joseph Schwind.

### Erie County

The stated meeting of the Medical Society of the County of Erie took place on April 25 at the Hotel Statler, Buffalo. The Most Reverend John A. Duffy, Bishop of Buffalo, spoke on "The Social Security Bill, Your Doctor, Your Hospital, and You."

The Buffalo Academy of Medicine will meet on May 17 in the Niagara Room of the Hotel Statler. Dr. Donald S. Martin, of Duke University, will speak on "Diagnosis and Treatment of Systemic Fungus Infections."

Ten Buffalo doctors, members of Emergency Base Hospital 31, spent the week of April 9-15 at the Halloran General Hospital, Staten Island, learning the latest developments in war medicine by helping Army doctors care for wounded men from overseas. Hospital 31 is composed of staff members of the

Millard Fillmore, Sisters, and Mercy Hospitals. All the civilian doctors are reserve officers of the U.S. Public Health Service. Dr. Harry C. Guess, director of Hospital 31, and Dr. Stephen L. Walczak are lieutenant colonels and senior surgeons. others, majors and surgeons, are as follows: Drs. Leslie A. A. Benson, Edward M. Tracy, Porter A. Steele, Allen E. Richter, Donald R. McKay, Pierce Taylor, Albert W. Palmer, and Edward T. Butler. Dr. Butler is adjutant of the unit. Dr. James P. Kinney and Dr. Margaret Warwick Schley also are in the unit but were unable to make the trip.\*

### Herkimer County

Dr. Ellery G. Allen, of the Syracuse University faculty, spoke on "Blood Diseases" before the county society on April 4 in the Mohawk Valley Country Club. The meeting, which opened at 4:00 P.M., was followed by dinner at 6:00 P.M.\*

Dr. Hans Kotrnetz and his wife, Dr. Margarete Kotrnetz, of Herkimer, who left early in April for service with the Army Medical Corps, were honored

at a farewell dinner given by members of the Herkimer Academy of Medicine.

Both were presented with traveling cases by Dr.

D. F. Aloisio, president, on behalf of the group. Dr. Hans Kotrnetz is a captain and his wife is a first lieutenant.\*

### Jefferson County

In April there appeared the first issue of the Northern New York Medical Annual, published by the Jefferson County Medical Society at Water-

Members of the editorial board are Drs. Howard N. Cooper, chairman, Charles A. Prudhon, Sutherland E. Simpson, William W. Hall, George F. Bock, and Garner Scullard, all of Watertown.

In the initial editorial Dr. Cooper writes, in part: "The first issue of a medical publication from Northern New York is, we hope, no trial balloon. We expect a yearly appearance of this magazine, and we hope each issue will exceed the previous one

in excellence. "The essential justification, or better, the vital need for such a feature in the professional life of this district is especially evident in these kaleidoscopic times. Life, for those of us who are relegated to carry on for the duration on the home front, is undergoing insidious and steady changes. These include technical, economical, social, and certainly our secretaries will agree, financial innovations. A proper consideration and lasting record of these changes should be made for us. We can then more clearly follow significant steps in the evolution of the present-day practice of medicine. This journal will likewise help to inform our absent members, who are equally concerned in knowing to what they will

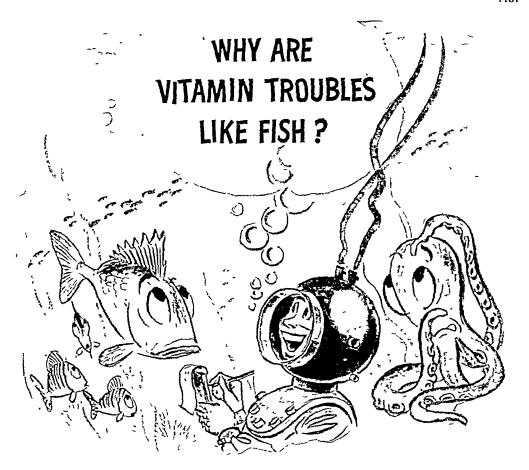

"The principal purpose of this publication is to establish its scientific decor by collecting papers written by component members. This will also written by component members. serve to stimulate other works to be written, and to provide an outlet for our season's orbit, no matter how humble or brief. Just as interesting and instructive medical cases are found in this County as anywhere. And, if we may be pardoned the frag-rance of a bouquet, we feel that most of them are handled and treated just as sagaciously as elsewhere.

A stated meeting of the county society and the Academy of Medicine of Brooklyn was held in MacNaughton Auditorium, Tuesday evening, April Kings County

The first speaker on the scientific program was Dr. Robert Elman, of St. Louis, Missouri, whose address was entitled "On the Intravenous Use of

Amino Acids." Dr. Elman is associate in surgery at St. Louis Children's Hospital and St. Louis Maternity Ho-

pital, director of surgery at Homer Phillips Hospital. St. Louis, and associate professor of surgery at Washington University in St. Louis.

Dr. I. M. Tarlow, of Brooklyn, spoke on "Plasma

Clot Suture of Peripheral Nerves.

Dr. Tarlow is a neurosurgeon at Jewish Hospital in Brooklyn, instructor in neurosurgery at New York Medical College, and attending neuropathologist at Beth Israel Hospital.

Dr. Irving J. Sands, acting president of the Brooklyn Jewish Hospital's medical board, spoke of socialized medicine as "racketeering in human lives" in an address delivered at the hospital's forty-second annual meeting held April 2 in the Louria Memorial Hall. He said that passage of the Wagner-Murray-Dingell bill would nullify the work of the medical profession, would necessitate politics in medicine, and would eventually result in a totalitarian form of government. Medicine is already making its own plans for the future, he said, with the relocation of physicians and the rehabilitation of those returning from service.

Other speakers were Lt. Col. Harold G. Hoffman, former Governor of New Jersey, former Justice Edward Lazansky, Mr. Charles Jaffa, and Mrs. Clarence G. Bahrach.\*

### Monroe County

Dr. James Knight Quigley, of Rochester, is this year's recipient of the Albert D. Kaiser Medal, an annual award presented by the Rochester Academy of Medicine for outstanding public service in medi-

Dr. Quigley's work on the Committee on Maternal Welfare of Monroe County and his service as a medical examiner for the State Board of Regents are among his contributions which won him the honor.

### Nassau County

The regular monthly meeting of the county society was held on April 25 at 9:00 P.M in the auditorium of Mercy Hospital in Rockville Centre.

The scientific session included an address, chiatric Rehabilitation-New Methods in Military Psychiatry as It Affects the Treatment of Such Casualties in Training and Combat," by Maj. Benjamin H. Balzer, (MC), chief, Neuropsychiatric Service, Station Hospital, Mitchel Field, and a motion picture, "Psychiatry in Action."

Dr. J. A. Mayer has been discharged from the Army and is practicing again in Freeport.

Dr. David S. Dooman has also been discharged from the Army and is practicing again in Garden City.

### New York County

An address entitled "Program of the Committee for Recruitment and Education of Practical Nurses of The Practical Nurses of New York, Inc.," was of The Practical Nurses of New York, Inc.," was one feature of the county society's monthly meeting held on April 24 at the New York Academy of Medicine.

The remainder of the scientific session consisted of a "Symposium on Applied Therapeutics." The speakers and their subjects were: "Treatment of Tropical Diseases," by Dr. Harold W. Brown, professor of parasitology, DeLamar Institute of Public

Health, College of Physicians and Surgeons, Columbia University; "Atypical Pneumonias" by Lt. Comdr. Frank L. Horsfall, Jr., (MC), USNR, of the U.S. Naval Research Unit, Hospital of the Rockefeller Institute for Medical Research; and "Chemotherapy," by Maj. Norman Plummer, (MC), of the War Department, Service of Supply, Board for the Investigation of Epidemic Diseases, U.S.A.

Dr. Sophia Kleegman, assistant clinical professor of obstetrics and gynecology of the New York College of Medicine, president of the Women's Medical Association of New York City, and charter member of the American Association for Marriage Counsellors, was guest speaker at a recent luncheon meeting of the Albany Maternal Guidance Association.

The Tau Chapter of the Nu Sigma Nu medical fraternity will sponsor its annual, open Walter L. Niles Memorial Lecture on May 18, at 8:00 P.M. in the Cornell University Medical College Auditorium, 1300 York Ave., New York City. Lt. Col. Loyal Davis, M.D., Ph.D., professor of surgery since 1932 at Northwestern Medical College, will talk on his "Experiences as Consultant in Neurological Surgery in the European Theatre of Operations.

Lt. Col. Davis was consulting neurological surgeon to the present American Expeditionary Forces until his return to the United States this year. In this capacity, he has done research on high-altitude frostbite and related aviation diseases peculiar to this war. During this time he was also a member of the Anglo-American Surgical Com-mission that toured Russia to study Russian military-medical methods and organization.

Dr. Davis is well known for his important contributions in the field of nerve grafts and nerve regeneration. In addition, he is editor of the Journal of Surgery, Gynecology, and Obstetrics, and author of several medical textbooks, including Peripheral Nerve Injuries and Neurological Surgery.

for which The annual Niles public lectures, prominent outside medical workers are invited to Cornell, are held as a tribute to the late Walter L. Niles, the past, beloved dean of Cornell University

Medical College.

#### Onondaga County

The Edward C.Reifenstein professorship of medicine will be set up through a stipulation in the will of the late Horace White, former governor of New York. After establishing life trust funds of \$200,-000, the will provides that three-fourths of the residuary estate shall go to Cornell University at Ithaca and one-fourth to Syracuse University College of Medicine, the latter to be known as the Horace White Fund and the income to be used to pay the salary for the Reifenstein professorship. The \$200,000 set up for life trusts will ultimately go to the two universities in their proportionate shares.

### Oswego County

"Medicine in the Postwar World" was the title of an address given by Dr. K. Wood Jarvis before the Oswego Rotary Club on April 4.\*

### Queens County

The April stated meeting of the county society was held in conjunction with the staffs of Queens

General Hospital and Triboro Hospital.

The entire program was dedicated to the United States Naval Hospital at St. Albans, in appreciation of that institution's hospitality to the Second District Branch of the Medical Society of the State of New York on November 17, 1943. The sessions were held on April 25.

The first activity, at 2:30 p.m., was a tour of Queens General and Triboro hospitals, which included observation of pathologic and roentgenologic demonstrations. A clinic was held in the auditorium of Triboro Hospital from 3:30 to 6:30 p.m., at which short papers were read by staff members. A dinner followed the clinic session, and the meeting of the county society took place at 9:00 p.m.

The program presented during the tour of the hospitals included: "Exhibition—Forms of Intereranial Injury," by Drs. Alfred Angrist and Richard Grimes; "Newer Methods in Diagnostic Roentgenologs," by Drs. Irving S. Startz and Mortimer Camiel; and "Demonstration of Lung Pathology," by members of the staff of Triboro Hospital.

The program for the clinical session was as follows: "Parathyroid Tumors," by Dr. Charles B. Livoti; "A New Method of Closed Treatment for Post-Lip Fracture of the Tibia," by Dr. Frederick C. Courten; "Traumatic Epilepsy," by Dr. Frederic Wertham; "Incisional Hernia," by Dr. Louis J. Morse; "Precancerous Dermatoses," by Dr. Ida J. Mintzer; "Influenzal Meningitis," by Dr. Henry A. Reisman; "Liver Function Tests in the Differentiation of Medical and Surgical Jaundice," by Dr. Harry LeVeen; and "Torsion of the Spermatic Cord," by Dr. Leo Goldberg.

Three speakers participated in the final program, which was the regular meeting of the county society. Dr. Nicholas D. Tiscione spoke on "Postoperative Nutrition." Dr. Morris S. Bender had as his topic "The Pathways of Infection in Sinus Disease," and "Indications and Results of Lobectomy and Pneumonectomy—Analysis of 100 Consecutive Cases" was the title of a paper by Dr. Herbert C. Maier.

"The Recognition, Management, and Treatment of Nervous Disorders by the General Practitioner," by Frederic Wertham, M.D., a short course of three lectures, is being given on three consecutive Friday afternoons, May 12, 19, and 26, under the auspices of the county society.

Dr. F. Wertham is the director of the Mental Hygiene Clinic, Queens General Hospital, and senior psychiatrist of the New York Department of Hospitals. In the past he has been chief resident psychiatrist at Johns Hopkins Hospital and associate in psychiatry at the Johns Hopkins Medical School; and director of the Mental Hygiene Clinic at Bellevue Hospital. He was assistant professor of psychiatry at New York University for six years, is the author of The Brain as an Organ, and has testified as psychiatric expert in a number of important trials of the past nine years.

### Schenectady County

The monthly meeting of the county society for May was held on May 2 at the Glenridge Sanitarium in Schenectady.

in Schenectady.

The speaker, Dr. William F. Reinhoff, associate professor of surgery at Johns Hopkins University, had for his topic "Indications for Pneumonectomy."

#### Seneca County

To protect the health of their employees, Seneca County industries have begun a program during which 400 workers at Evans Chematics plant in Waterloo and 275 workers at the Seneca Knitting Mills in Seneca Falls, were given the tuberculin "patch" test.

Thirty-three per cent of these showed positive

results and will be given the x-ray test.

This program, which has the endorsement of the Public Health Committee of the Seneca County Board of Supervisors, and the County Medical Society, is under the direction of Miss Ruth Page, executive secretary of the Seneca County Committee on Tuberculosis and Public Health. The three county nurses are assisting.\*

#### Steuben County

Members of the county society heard a talk by Dr. Stockton Kimball, of Buffalo, at the regular quarterly meeting on April 13. Dr. Kimball's topic was "Malaria, the Dysenteries, and Filariasis."\*

### Nurses from Other American Republics to Study Here

EIGHTEEN sisters from eight American republics will reach this country in May for a oneyear specialized training course in nursing sponsored by the Catholic Hospital Association, in cooperation with the Institute of Inter-American Af-The institute is an agency of the Office of Inter-American Affairs here.

The first course, scheduled to begin on May 15, will find two representatives each from Costa Rica, Chile, Ecuador, El Salvador, Nicaragua, Peru, and Venezuela. Mexico will be represented by four

students.

The sisters will take a preliminary orientation course of approximately two months' duration at the headquarters of the Catholic Hospital Association in St. Louis, Missouri, before going on to a four months' in-service training course at various hospitals in the United States. Assignments to hospitals will be made by the Institute of Inter-Ameri-

can Affairs in accordance with each student's specialized field.

At the conclusion of the first four month's inservice training period, the sisters will be brought together for a joint résumé of the work which they have completed. After a month spent in comparing notes, the students will receive an additional four months' training at other hospitals. A final onemonth consultation before returning to their respective countries will complete their course.

Specialized fields covered by the program include general nursing, nursing education, admissions, records, dietetics, x-ray treatments, physical therapy, and general hospital administration. The program is made possible by a special grant of the Institute of Inter-American Affairs, and will be supplemented by a second course, beginning on September 1, when sisters from additional American republics will come

to this country for training.

### Lecture Series Marks Memorial Hospital's Sixtieth Anniversary

THE Challenge of Cancer" is the title of a series of lectures in May, presented in celebration of the sixtieth anniversary of Memorial Hospital for the Treatment of Cancer and Allied Diseases, New York City. The meetings take place in the Auditorium at Memorial Hospital, on Saturdays at 11:00 A.M.

On Saturday, May 6, Harry Pelham Robbins, president of Memorial Hospital, spoke on the subject "Sixty Years of Service." Dr. Fred W. Stewart, pathologist and acting director of Memorial Hospital, spoke on "The Development of Cancer Diagnosis." "The Development of Cancer Treatment" was the lecture delivered by Dr. George T. Pack, attending surgeon at Memorial Hospital.

On May 13 Edward C. Delafield, treasurer of the hospital, gave a talk called "The Way the Cancer Problem Appears to Me, a Layman." Dr. Lloyd F. Craver, attending physician at Memorial Hospital, spoke on "The Organization of a Modern Cancer

Hospital."

"How to Reduce Cancer Mortality" was the subject discussed by Dr Clarence C. Little, managing director of the American Society for the Control of Cancer.

The series will be continued on Saturday, May 20, with "The Years That Lie Ahead" by Reginald C. Coombe, chairman of the executive committee of Memorial Hospital. Dr. Carl Voeglin, former director of the National Cancer Institute, will then speak on the topic, "Whither Cancer Research." Dr. Jules C. Abels, assistant physician at Memorial Hospital, will deliver the lecture "Making the Cancer Patient Safe for Treatment." The time is 11:00 A.M.

The series will alone or Saturday May 27 with

The series will close on Saturday, May 27, with tours of the Hospital starting at 10:00 a.m., 10:30 a.m., and 11:00 a.m. The tours will start in the solarium and will proceed through the operating suite, the private floor, the semiprivate floor, the laboratory floor, the x-ray department, and the dietary department.

dietary department.

### Army Dedicates Hospital in Atlantic City

ENGLAND GENERAL HOSPITAL, where hundreds of soldiers are recovering from wounds GENERAL HOSPITAL, and sickness, was dedicated April 29 at ceremonies attended by Army officers and civilian officials.

The largest hospital of its kind in the United States, England General Hospital is composed of five Atlantic City hotels and has a capacity for 4,760 patients. The hotels are Haddon Hall, Chalfonte, Traymore, Dennis, and Colton Manor. The Army has made them into an institution where soldiers help the process of healing by doing things for themselves.

Among the three generals at the exercises was Lt. Gen. Brehon B. Somervell, commanding general of the Army Services Forces. He said: "It's a matter of pride to the Army Medical Corps, and it should be a matter of satisfaction to all Americans, to know that we will have ready and waiting adequate facilities for all our battle casualties."

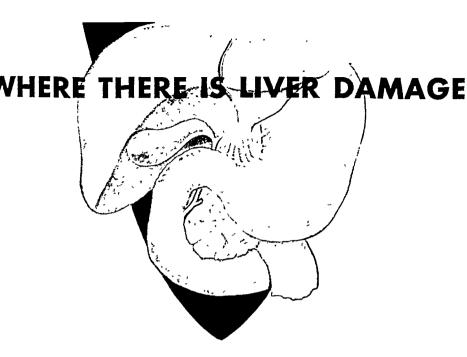

General Somervell said that the Army's sixty-

three large general hospitals and other medical facilities have enough beds to care for the total number of wounded anticipated in "the coming compaign." Other speakers included Gen. Thomas A. Terry,

of the Second Service Command, of which the hospital is a post, Maj. Gen. Norman T. Kirk, Surgeon General of the Army; Mayor Thomas D. Taggart of Atlantic City, and Governor Walter E. Edge.

England General Hospital was named in honor of the late Lt. Col. Thomas Marcus England, a hero of the yellow fever experiments in Cuba in 1900. He volunteered, under Maj. Walter Reed, to stay for twenty days in a bed previously used by a yellow fever victim and by doing this he helped to prove that yellow fever was transmitted by mosquitoes and not by contact with an infected person or ob-Colonel England was executive officer of the Fifth Service Command's medical branch when he died at Columbus, Ohio, on July 23, 1943.

### Improvements

A gift for postwar construction of a research laboratory at Mount Sinai Hospital in New York City has been announced by Waldemar Kops, its acting president.

The donor was Dr. A. A. Berg, president-elect of the International College of Surgeons and consulting surgeon to the hospital. The gift was in memory of his brother and medical associate, Dr. Henry W. Berg, who died in 1938, at the age of 79. Neither the donor nor the hospital authorities would divulge the amount of the fund.

Construction of the unit, to be known as the Henry W. Berg Research Laboratory Building, will be started as soon after the war as material and labor become available. The site will be among Mount

Sinai's group of eighteen buildings.\*

Inspection of the enlarged and renovated kitchen of White Plains Hospital featured the monthly meeting of the board of governors on February 21. A. J. Purdy, first vice-president and chairman of the building and grounds committee, who directed the improvement, led the inspection party.

The cost of \$22,500 was provided from unre-stricted invested funds, Mr. Purdy announced.

New features include a separate kitchen where special diets are prepared and student nurses are taught dieteties, a soundproof dishwashing room, and expanded refrigeration facilities. New equipment includes a pie stove, three-tiered vegetable steamer, a potato peeler, and two steamtables.\*

Plans for a new Training School for Nurses at Bellevue Hospital, to cost \$3,500,000, were filed on March 15 with the New York City Department of Housing and Buildings. The project, which will be one of the first units in the Hospital's general reconstruction program after the war, will occupy the entire block bounded by First Avenue and the East River from Twenty-fifth to Twenty-sixth Street, just south of the main Bellevue buildings.

The block contains the present training school, a nurses' residence, and other buildings. These will be displaced by the new school, residences, and a garage, according to Dr. Edward M. Bernecker, Commissioner of Hospitals, who said that the new institution and residential quarters would be part of the hospital's postwar building development.

Plans for other building projects in the Bronx and Brooklyn were also filed.\*

#### At the Helm

Colonel George Baehr, former president of the medical board of Mount Sinai Hospital in New York City, clinical professor of medicine at Columbia University, and until recently Chief Medical Officer of the U.S. Office of Civilian Defense, has resumed his duties as attending physician to the First Medical Service of Mount Sinai and will undertake new duties as director of clinical research.

Dr. Isidore Snapper, Dutch scientist, formerly on the faculties of the University of Amsterdam and the University of Peiping, and more recently Medical Adviser to the Government of the Netherlands West Indies, has been appointed attending physician to the Hospital's Second Medical Service and director of graduate medical education.

Dr. J. Moss Beeler has been appointed hospital administrator of the Flower and Fifth Avenue Hospitals in New York City. Since his graduation from the Medical College of the University of Louisville, Dr. Beeler has been associated with hospital administration and mental hygiene. He is a Fellow of the American College of Hospital Administrators and the American Psychiatric Association. He was formerly superintendent of Grady Hospital, associate professor of psychiatry at Emory University School of Medicine. Between his appointments at Emory and the New York Medical College he was Director of the Department of Mental Hygiene of the Mississippi State Hospital.

Dr. Willard C. Rappleye, dean of the College of Physicians and Surgeons, was re-elected chairman of the Research Council of the Department of Hospitals of New York City. Commissioner Edward M. Bernecker was re-elected vice-chairman; Dr. Alfred E. Cohn, of Rockefeller Institute, treasurer,

and Dr. Walter G. Lough, president of the medical board of Goldwater Memorial Hospital, secretary. Dr. Thomas I. Price, general medical super-intendent of the department, was elected assistant secretary, and Gordon T. Broad, deputy commissioner of hospitals, was named assistant treasurer.\*

Appointment of Dr. Bernard T. Brown, senior resident physician at the Onondaga Sanatorium in Syracuse, to the post of superintendent to succeed Dr. Eugene Bogardus, has been announced by Dr. H. Burton Doust, chairman of the board of managers.\*

### Improvements

A gift for postwar construction of a research laboratory at Mount Sinai Hospital in New York City has been announced by Waldemar Kops, its acting president.

The donor was Dr. A. A. Berg, president-elect of the International College of Surgeons and consulting surgeon to the hospital. The gift was in memory of his brother and medical associate, Dr. Henry W. Berg, who died in 193S, at the age of 79. Neither the donor nor the hospital authorities would divulge the amount of the fund.

Construction of the unit, to be known as the Henry W. Berg Research Laboratory Building, will be started as soon after the war as material and labor become available. The site will be among Mount Sinai's group of eighteen buildings.\*

Inspection of the enlarged and renovated kitchen of White Plains Hospital featured the monthly meeting of the board of governors on February 21. A. J. Purdy, first vice-president and chairman of the building and grounds committee, who directed the improvement, led the inspection party.

The cost of \$22,500 was provided from unrestricted invested funds, Mr. Purdy announced.

· New features include a separate kitchen where special diets are prepared and student nurses are taught dietetics, a soundproof dishwashing room, and expanded refrigeration facilities. New equipment includes a pie stove, three-tiered vegetable steamer, a potato peeler, and two steamtables.

Plans for a new Training School for Nurses at Bellevue Hospital, to cost \$3,500,000, were filed on March 15 with the New York City Department of Housing and Buildings. The project, which will be one of the first units in the Hospital's general reconstruction program after the war, will occupy the entire block bounded by First Avenue and the East River from Twenty-fifth to Twenty-sith Street, just south of the main Bellevue buildings.

The block contains the present training school, a nurses' residence, and other buildings. These will be displaced by the new school, residences, and a garage, according to Dr. Edward M. Bernecker, Commissioner of Hospitals, who said that the new institution and residential quarters would be part of the hospital's postwar building development.

Plans for other building projects in the Bronv and Brooklyn were also filed.\*

pitals of New York City. Commissioner Edward

M. Bernecker was re-elected vice-chairman; Dr. Alfred E. Cohn, of Rockefeller Institute, treasurer,

and Dr. Walter G. Lough, president of the medical board of Goldwater Memorial Hospital, secretary. Dr. Thomas I. Price, general medical super-

intendent of the department, was elected assistant secretary, and Gordon T. Broad, deputy com-missioner of hospitals, was named assistant treas-

### At the Helm

Colonel George Baehr, former president of the medical board of Mount Sinai Hospital in New York City, clinical professor of medicine at Columbia University, and until recently Chief Medical Officer of the U.S. Office of Civilian Defense, has resumed his duties as attending physician to the First Medi-cal Service of Mount Sinai and will undertake new duties as director of clinical research.

Dr. Isidore Snapper, Dutch scientist, formerly on the faculties of the University of Amsterdam and the University of Peiping, and more recently Medical Adviser to the Government of the Netherlands West Indies, has been appointed attending physician to the Hospital's Second Medical Service and director of graduate medical education.

Dr. J. Moss Beeler has been appointed hospital administrator of the Flower and Fifth Avenue Hospitals in New York City. Since his graduation from the Medical College of the University of Louisville, Dr. Beeler has been associated with hospital administration and mental hygiene. He is a Fellow of the American College of Hospital Administrators and the American Psychiatric Association. He was formerly superintendent of Grady Hospital, associate professor of psychiatry at Emory University School of Medicine. Between his appointments at Emory and the New York Medical College he was Director of the Department of Mental Hygiene of the Mississippi State Hospital.

Dr. Willard C. Rappleye, dean of the College of Physicians and Surgeons, was re-elected chairman of the Research Council of the Department of Hos-

urer.\*

Appointment of Dr. Bernard T. Brown, senior resident physician at the Onondaga Sanatorium in Syracuse, to the post of superintendent to succeed Dr. Eugene Bogardus, has been announced by Dr. H. Burton Doust, chairman of the board of managers.\*

S. Berton Gerstner, D.D.S., has been appointed director of the dental department of Bronx Hospital.

Herman Hoffman has been elected president of the Adelphi Hospital of Brooklyn, according to an announcement by the Board of Trustees.

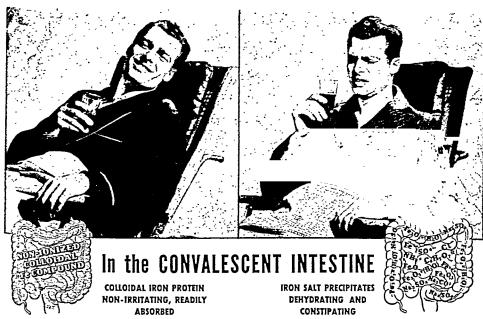

Mr. Hoffman succeeds Herman S. Bachrach.

Dr. William Y. Hollingsworth, medical officer-in-charge of the U.S. Marine Hospital at Chiton, has been transferred to the New Orleans Marine Hospital as director.\*

## COLLOIDAL // IONIZABLE IRON

IN CONVALESCENCE, the intestine plays an important role as an absorption center for nutriment, but it is characteristically subject to upsets. For these reasons, the intrinsic advantages of colloidal iron over ionizable iron in hematinic therapy are especially significant. Iron salts (sulphates, citrates, etc.) are ionized by the gastric juice. In the alkaline medium of the intestine they form precipitates which are not readily absorbed and are dehydrating and constipating. OVOFERRIN, on the other hand, is celloidal iron-protein. It is not in ionic form, and is not broken up by the digestive juices. It

remains assimilable since nutritive material in colloidal form is readily absorbed from the intestine. As it is fully hydrated, it *cannot* cause dehydration and constipation. It contains no acid radicle to irritate. Such is the biochemical basis for OVOFERRIN'S world-wide reputation as "the rapid blood-builder."

In addition, OVOFERRIN is odorless and tasteless, contains no sugar, does not irritate the stomach, and does not stain or dissolve tooth enamel. Prescribed in 11-oz. bottles—one table-spoonful in a wine glass of milk or water at meals and bedtime:

### Prescribe OVOFERRIN

[Continued from page 1144]

Dr. Edward J. Cristiano, formerly of Troy, has been elected president of St. Luke's Hospital at Pittsfield, Massachusetts. He succeeds Dr. Charles F. Fasce.\*

Dr. James C. Boland, a native of Troy, now assistant district health officer at Binghamton, is to be named Troy health officer to succeed Dr. James H. Flynn, who will retire May 15.\*

Arthur L. Zerbey has been re-elected president of the Mount Vernon Hospital Association.\*

Directors of the new Syracuse General Hospital have received a check for \$37,250 from the Federal Works Agency regional office in New York—the first payment of the government's share in the cost of crecting the new nurses' home.

Under the terms of the Lanham Act, the Federal

Works Agency agreed to pay \$149,000 of the total \$174,000 needed to provide the new building.\*

According to the Syracuse Post-Standard of March 3, three of the nine interns at the Syracuse University Hospital of the Good Shepherd are women. They are Drs. Katherine E. White, Margaret Newcomb Bird, and Helen-Ann Garcia.

The sixth class of hospital library volunteers have received certificates at the United Hospital Fund office in New York City and were assigned to book service to patients in voluntary and municipal hospitals. The forty-two members of the class bring the total of certified volunteers in this work to three hundred and fifty, a number that must be increased still further if the libraries are to remain open during the summer.

Miss Florence L. Schieren, chairman of the committee on hospital libraries, announced that the course consists of six lectures, twenty-one hours of practice training, and sixty hours of service. Volunteers give a minimum of two half-days weekly.\*

### **Newsy Notes**

The Jacob H. and Emma W. Schoonmaker Fund has been created under a gift of one million dollars to the United Hospital Fund of New York from a trust created in 1937 by the late Jacob H. Schoonmaker, of New York. The income from this sum is to be added to the annual collection made by the United Hospital Fund and distributed among the eighty-seven hospitals and homes participating. The remainder of the original Schoonmaker trust is divided equally among the Community Service Society of New York, the New York Foundling Hospital, Fordham University, and the Kingston Hospital, Kingston.

The medical library of Grasslands Hospital, in Valhalla, has recently moved to new quarters and now provides a pleasant reading room as well as a large stack room. More than 60 medical journals are available. The bound journals number 800 volumes and the major journals are all available for more than ten years. The Quarterly Cumulative Index is complete. In addition more than 2,000 particulates the said meangraphs are cured.

medical textbooks and monographs are owned.

The library is open from 9:00 A.M. until 5:30 P.M. seven days a week. Physicians are always welcome. A list of the journals carried will be supplied on request, or the librarian, Mrs. Katherine Grady, may be consulted by telephone.

Part of Beekman Hospital's \$600,000 contribution to the Fourth War Loan has been allocated by the United States Treasury Department to buy one of the Army's new-type hospital railroad cars, it was announced yesterday by Howard S. Cullman, president of the hospital.

Beekman will be the first New York hospital to be credited with purchase of one of the cars, estimated by the War Finance Committee to cost \$70,000 each. Other portions of the hospital's \$600,000 in bonds will be credited to the purchase of a hospital, hospital plane, equipment for a hospital ship, and a fleet of ambulances.\*

St. Joseph Hospital in Syracuse, the first hospital in Central New York, constructed in 1869, celebrated its seventy-fifth anniversary on April 12.\*

The War Production Board regional offices throughout the country are asking for the cooperation of every hospital, every doctor, every medical and dental unit, in the scrap paper program. They are requested to dispose of books, magazines, newspapers, records, wrappings, cartons, advertising literature, and bulletins. They are asked to ferret out every last scrap or shred of paper to go into the salvage paper drive.

Special hospital rations to supplement the standard field rations of the armed services have been developed by the Quartermaster Corps for use in field hospitals overseas. The ration is sufficient for twenty-five men and consists of canned fruits, fruit juices, dehydrated soup, coffee, sugar, and evaporated milk. Each of the components is packed in metal containers and the entire ration is packed in a wood box marked with the Red Cross insignia. Each box weighs about 60 pounds so that it can easily be transported even to hospitals in the fighting zones.—Modern Hospital, March, 1944.

The New York Medical College has recently been the beneficiary of two gifts from Mrs. John Eastman Wilson in memory of her late husband. Dr. Wilson was professor of neurology and was associated with the College from 1902 to 1918.

One gift of \$100,000 has been designated as a student loan fund for needy medical students. The other gift of \$10,000 has been added to the endowment of the Department of Surgery.

The formation of a Hospital Circuit, over which specially selected entertainment units will travel at least once every fortnight to take new shows to men in Army and Navy hospitals throughout the country, has been completed by USO-Camp Shows, Inc. The circuit was organized in cooperation with the Service Division of the War Department to provide additional divertissement for the men.

The group is headed by well-known artists of the stage, radio, screen, and concert fields. stage, radio, screen, and concert licius. Alleady making the rounds are four units, the personnel of which includes Ed Wynn, Gene Kelly, Wini Shaw, Leslie Brooks, Trudy Marshall, Diana Lure, Paul Lavarre, Pat Hill, Michael Olivierre, Charley Stuart, Frank Sully, Lynne Carver, Russell Delagar Truckhon.\*

mar, and Sidney Tuschner.\*

Lucius Nathan Littauer, of New York City, who died on March 2, bequeathed \$250,000 to Nathan Littauer Hospital in Gloversville.

The U.S. Naval Hospital at Sampson celebrated its first birthday on February 27.

On March 15 Northern Westchester Hospital opened a campaign to raise \$500,000 for the enlargement and improvement of the hospital.

Dr. Oswald S. Lowsley, of New York City, recently returned from a tour of inspection of United States naval hospitals in his capacity as honorary consultant to the Medical Corps of the United States Navy. The tour included fourteen naval hospitals in the Middle West, on the Pacific Coast. and on the Gulf of Mexico. In addition to making his inspection Dr. Lowsley addressed the medical officers of the various hospitals on "The Diagnosis and Treatment of Various Traumatic and War Injuries of the Organs of the Genital and Urinary Tracts."

A total of \$554,369 in Fourth War Loan subscriptions was raised by employees of New York's municipal hospitals, Dr. Edward M. Bernecker, Commissioner of the Department of Hospitals, reported.

This compares with \$353,097 raised by the hospital employees during the Third War Loan.

Greenpoint Hospital employees headed the list, with a total of \$192,143. Other leading totals were: Metropolitan Hospital, \$55,600; Coney Island Hospital, \$40,113; Fordham Hospital, \$35,801; Bellevue Hospital, \$30,901; and Kings County Hospital, \$18,558.

### MEDICAL AND SURGICAL RELIEF COMMITTEE DONATES 1,000TH KIT TO NAVY

The Medical and Surgical Relief Committee of America recently donated its 1,000th small-vessel medical kit, designed for use on board sub-hunting, Joseph P. Hoguet, medical director of the Committee, turned over the 1,000th emergency medical set to Capt. Ernest R. Eaton of the Navy Medical Supply Corps at a brief ceremony at Committee headquarters in New York City. This kit and the 1,001st were earmarked for a Landing Craft Tank Detachment of Group 44, Flotilla 15, U.S. Navy, in answer to a request from the Commanding Officer for medical supplies.

The donation of the 1,000th small-vessel casualty kit by the Committee to the Navy celebrated the first anniversary of this special project. March, flooded with requests from pharmacist's mates and medical and ship commanding officers of the Coast Guard and the Navy, the Medical and Surgical Relief Committee, a philanthropic organization dedicated to medical aid, launched a program to send medical equipment to small Navy ships that asked for and needed immediately these vital supplies.

Among those ships that appealed to the Com-Dr. Hoguet listed sub-chasers, motortorpedo boats, destroyer escorts, rescue ships, mine sweepers, gunboats, and landing craft for tank and

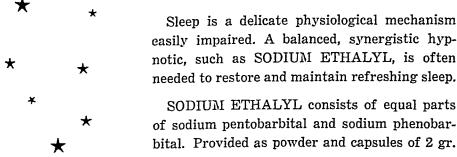

Hundreds of grateful letters in the Committee files testify to the urgency of the Committee's work to supplement the medical allotment of certain Navy vessels, declared Dr. Hoguet. Specially designed by Committee physicians for

small doctorless craft, the kits are equipped to give professional on-the-spot treatment to the ill or injured until they can be safely transferred to a base hospital, Dr. Hoguet explained. To enable pharmacist's mates and nonmedical officers to make effective use of its contents, detailed instructions are included in each set. In addition to the bandage, instrument roll, and essential drugs, the kit contains a shipwreck unit—a simple fishing rig, dried bait, metal signaling mirrors, and a sturdy floating knife. Since the kits are easily carried and packed for immediate use, they can be rushed directly to the casualties in emergencies or during combat.

The Committee's Navy program is but one phase of its medical relief work. To date, more than \$620,000 worth of medical, dental, and surgical supplies have been donated to the fighting forces of the Alliant to the fighting forces of the Alliant to the fighting forces of the f the Allies, to war-zone hospitals, needy welfare groups, medical missionaries, and community nurseries throughout the free world.

### Woman's Auxiliary

### To the Medical Society of the State of New York

### County News

Albany.—The auxiliary members have been taking an active part in selling War Bonds. Red Cross work has also been one of their pastimes. A silver tea was held for a Red Cross benefit. During the year many speakers have been heard. Many of the meetings have been open to the public. The war against cancer is also under way. Mrs. James S. Lyons has been county president this year.

Broome.—At the March meeting, the Nurses' Glee Club of the Charles S. Wilson Memorial Hospital, Johnson City, sang several selections. Mr. Kenneth Van Cott spoke on "Jewels." He displayed uncut stones and pieces of jewelry. At the April meeting, at Our Lady of Lourdes Memorial Hospital in Binghamton, Capt. Nicholas Klimow talked on the war and of the people "down under." Lieutenants Novak and Blazicek also spoke. A silver tea was held on April 26, at the home of Mrs. John D. Bowen. In May, at a dinner meeting, the guests will be the husbands of the members and the wives of the men in service. At the annual meeting a luncheon will be served and annual reports will be given, followed by election of officers.

Cattaraugus.—Five business meetings were held this year. The speakers for the meetings were Mrs. M. McIlnay, on the subject, "The Wife of an Army Doctor"; Dr. C. A. Greenleaf spoke on medical advancement; Miss Johanson discussed problems in hospitals today. A sunshine committee was organized to send flowers or cards to members who are ill. A contribution of ten dollars was sent to the Physicians' Home and a donation was made for Christmas flowers for Rocky Crest Tuberculosis Sanitorium. The members had a booth for the Third War Loan Drive. Every member is giving of her time to war work. Mrs. J. A. Wintermantel delivered a baby at the County Home, when her husband was unable to attend the patient.

Cayuga.—Two "camperships" for Girl Scouts were financed. The members mended garments for the children at the Convalescent Home. Snacks were provided for the student nurses' kitchenette. Two legislative meetings were held; the Honorable James Chase and Dr. Cornelius McCarthy were the speakers. Mrs. John Hamil, a former teacher in China, spoke on the health problems of that country. Dr. Wm. Dorr spoke on the health problems of the Army and Navy both in this country and in foreign stations.

Chautauqua.—Four meetings have been held during the year. At each meeting an interesting program was planned. The average attendance has been twenty. A monthly potluck supper meeting has been held at the homes of the members. The spirit of friendliness and cooperation has increased this year.

Columbia.—The April meeting was a luncheon meeting at the General Worth Hotel. Mrs. Hugh Henry is acting as president again this year.

The auxiliary carries on its list as honorary

members the wives of all members of the county medical society who are now in service.

The meetings are limited for the duration to April, June, October, and January. The members are all helping with Red Cross work and War Bond sales. The projects for the year have been to preserve the unity of the Auxiliary, to serve in the war effort in the most expedient ways, to familiarize the public with the Wagner-Murray-Dingell bill, and to obtain written pledges of protest to our Congressman.

Erie.—At the last meeting, Mrs. Walter Goodale, chairwoman of the Bond and Stamp Booth, reported that in the last Bond drive a quota of \$35,000 and \$1.489.70 in excess of it was raised.

\$1,489.70 in excess of it was raised.

Twice monthly the members meet at various homes to knit afghans for the Red Cross. The meeting in the homes of the Red Cross group shows a desire to contribute toward the comfort of the boys in service, and also strengthens the bonds of friendship and common effort in the group. Betty Wertz, the incoming president, is from Eric county.

Essex.—Two meetings were held this year. The members are all very busy with Red Cross work and first aid. The Wagner-Murray-Dingell Bill has been talked about whenever possible.

Fulton.—Monthly meetings have been held, usually in the homes of the members. Occasionally a dinner meeting was held elsewhere. The members have done their bit in opposing the pending medical legislation. The auxiliary has contributed to the Red Cross and the Physicians' Home and has purchased War Bonds. The members are active in work for the Red Cross, the Ration Board, and the Blood Bank.

Mrs. F. Leslie Sullivan, State President, was a

guest at a dinner meeting.

Herkimer.—Dr. Joseph S. Lawrence was one of this year's guest speakers. A fourth anniversary party was held in April at the Mohawk Valley Country Club.

The auxiliary is assisting the local librarian in furnishing books and magazines for the Herkimer Memorial Hospital. The members are also dis-

tributing flowers in the Hospital.

Installation of officers will take place at the final meeting in May.

Madison.—Auxiliary meetings have been held throughout the year. The public relations chairman represented the auxiliary in speaking to different clubs and groups of people about medical legislation.

Montgomery.—An interested audience listened to Dr. Joseph S. Lawrence's talk on socialized medicine. The medical society and the auxiliary entertained Dr. and Mrs. Lawrence at dinner.

Nassau.—The membership is 159. Forty-nine of the members are wives of men in service. The auxiliary has cooperated with the following county agencies: Mental Hygiene Committee at their [Continued on page 1152]

annual Institute held in Mineola, New York; Annual County Fair Health Exhibit; County Cancer Committee at their Annual Institute in Garden City.

Three box luncheons have been held. Six thousand hours of war work have been done by the members. Speakers have been provided to talk on legislation.

One hundred dollars has been donated to the Physicians' Home Fund. Twenty-four subscriptions to Hygeia were taken. Hygeia was also donated to eleven schools and to seventeen libraries.

Niagara.--Mrs. E. F. Dodge was elected president at the luncheon meeting held at Lockport Country Club. Dr. Grant Guillemont, president of Niagara County Medical Society, and Dr. Richard Sherwood, of Niagara Falls, were the afternoon speakers.

Oneida.—At the February meeting a luncheon was held at the Hotel Utica. Forty-five members were present to honor the members whose husbands are in service. The guest speaker was Maj. James McDaniel, chaplain of Rhodes General Hospital.

At the April meeting Dr. Newton J. T. Bigelow, deputy commissioner of Mental Hygiene of New York State, was the speaker. Mrs. Ward Millias was the guest soloist. Mrs. Donald Reals, president, presided.

Onondaga.—The meetings have been fewer than usual this year. At the March meeting Miss Edith Smith, Dean of the Syracuse University School of Nursing, spoke on the Cadet Nurses' Training Program. At the luncheon preceding the meeting seventy-five members were present. The charter members were honored and a report was given by Mrs. Francis R. Irving.

Queens.—The project for the year was the Fort . Totten Army Hospital. Mrs. William J. Godfrey visited the hospital and made the rounds of the wards distributing candies and smokes. were purchased and books also were furnished. The money raised at two card parties sponsored

The members are doing Red Cross work and are acting as air raid wardens. Mrs. J. M. Dobbins, the president, is a member of the blood donor "Gallon Club."

Rensselaer.—Dr. Joseph S. Lawrence addressed the auxiliary during the year.

Mrs. John J. Noonan and Mrs. Warren St. John were selected as delegates to the Annual Conven-

Saratoga.—The F. B. I. in action was the topic at the April meeting.

Mrs. Thomas E. Bullard is president.

A picnic is to be held in June. Mrs. F. Leslie Sullivan, State President, and Mrs. E. MacDonald Stanton were guests of the Saratoga County auxiliary recently.

A donation of money was made to the Red Cross and volunteer workers have been securing blood

Mrs. James J. McNaughton attended a legislative meeting in Albany.

Schenectady.—The March meeting was a luncheon meeting, at which Mr. C. Czyzewski spoke on Russian-American relations. The April meeting consisted of a luncheon, legislative discussion, and business. In May there will be the annual covereddish luncheon and election of officers. During the year the members have been engaged in the Third and Fourth War Loan Drives, the Red Cross Drive, part-time nursing at the local hospital, teaching home nursing, and as blood donors.

Suffolk .- Mrs. E. Raymond is the county president for 1944. Five general and executive meetings have been held.

A needlepoint footstool was donated by the president. The sum of \$78.90 was realized from the drawing on the stool. The necessary amount was added to make a \$100 donation to the Physicians' Home. An added amount of \$100 was sent to the State Treasurer for the Physicians' Home fund. The membership is thirty.

Mrs. William C. Carhart is the State Parliamen-

tarian.

Warren.—Mrs. F. Leslie Sullivan visited Warren County in November.

The annual meeting will be held May 17.

Most of the members have been engaged in war service activities. Many letters have been sent opposing the Wagner-Murray-Dingell bill.

Washington.—Ninety per cent of the members are engaged in war work. The county is carrying on.

### PUBLIC TO SEE FILM ON VENEREAL DISEASE

Prints of "To the People of the United States," a two-reel educational film dealing with the subject of venereal disease, will be made available for theatrical exhibition by the California State Department of Public Health, it was announced by Walter Wanger, who produced the film at the request of the United States Public Health Service. The latter agency withdrew its sponsorship of the film for general public showings after receiving a protest from the National Legion of Decency.

In announcing that the picture would be shown in New York and that the California Health Department would provide prints "to the many exhibitors who have indicated their desire to show the film," Mr. Wanger said he made the subject with public funds at the request of Dr. R. A. Vonderlehr, Assistant Surgeon General; that the script was supervised by Cmdr. L. E. Burney of the Surgeon General's staff, and that the picture had also met

with the approval of the Army and the Office of War

Information before the protest.

Mr. Wanger said the complaint of the Legion of Decency that the picture, "while essentially dignified and restrained, nevertheless fails to emphasize the evils of promiscuity," is not consistent with the film.

He added that "it presents its educational story around the remorseful figure of a bomber pilot who cannot go abroad with his crew because he has contracted a venereal disease."

Mr. Wanger said the picture did not violate the Production Code section on sex and hygiene, pointing out that the code "does not and was not intended to apply to educational government films." However, he declared the Production Code does apply to such matters in commercial pictures and "would therefore prevent 'the flood of lurid pictures' feared by the Legion of Decency."

### Health News

### Winslow Succeeds Mustard on Public Health Journal

Professor C.-E. A. Winslow is the new editor of

the American Journal of Public Health, succeeding Harry Stoll Mustard, M.D. He took office in April.

Professor Winslow is Anna M. R. Lauder Professor of Public Health at Yale University. His identification with the American Public Health Association has been long and intimate. He served as chairman of its Committee on Administrative Practice for fifteen years and as chairman of the Committee on the Hygiene of Housing since its establishment seven years ago. He was elected president of the Association in 1926, and received a certificate for forty years of continuous membership and the Sedgwick Memorial Medal for distinguished service to public health in the same year, 1942.

He has written many articles, pamphlets, and books. Among his books are The Life of Hermann M. Biggs, The Evolution and Significance of the Modern Public Health Campaign, A City Set on a Hill, Health on the Farm and in the Village, and Health Under the "El." His latest book is The

Conquest of Epidemic Disease.

### National Society for the Prevention of Blindness Elects Officers

The election of Mrs. Eleanor Brown Merrill, executive director of the National Society for the Prevention of Blindness, as president of the National Health Council for 1944 was announced on March 15. She is the first woman to be elected president since the founding of the Council in 1921. Mrs. Merrill succeeds Dr. George S. Stevenson, medical director of the National Committee for Mental Hygiene.

Other new officers are: vice-president, Dr. Walter Clarke, executive director of the American Social Hygiene Association, who succeeds Dr. Kendall Emerson, managing director of the Natural Conference tional Tuberculosis Association; secretary, Professor Maurice A. Bigelow, president of the American Eugenics Society; Treasurer, Dr. William F. Snow, general director of the American Social Hygiene Association. Dr. G. Foard McGinnis, director of Medical and Health Services, American Red Cross, was elected to the Board of Directors.

The National Health Council is a clearing house of twenty voluntary health organizations. Council maintains a library whose facilities are used by research workers from all parts of the United States and, particularly, by students of medicine, nursing, and public health from nearby colleges and

universities.

The Library contains more than six thousand volumes and thirty thousand pamphlets dealing with public health sanitation, and related subjects; more than five hundred professional journals and technical periodicals are received regularly from all parts of the world. An annual guide is prepared for publication in the Book List of the American Library Association, and the library issues its own weekly bulletin, giving brief digests of current magazine articles pertaining to health matters.

Active member agencies in the National Health Council include the following: American Eugenics

Society, American Heart Association, American Public Health Association, American Red Cross, American Social Hygiene Association, American Society for the Control of Cancer, American Society for the Hard of Hearing, Conference of State and Provincial Health Authorities of North America, Maternity Center Association, National Committee of Health Council Executives, National Committee for Mental Hygiene, National Organization for Public Health Nursing, National Society for the Prevention of Blindness, and the National Tuberculosis Association.

Associate member agencies are: American Association of Medical Social Workers, American American Diabetes Association, American Nurses' Association, Foundation for Positive Health, Laymen's League Against Epilepsy, and the Planned Parenthood

Federation of America.

The U.S. Public Health Service and the U.S. Children's Bureau are advisory members.

### Department of Health Initiates Pioneer Campaign to Make Homes Safe

The first organized effort in a large American city to treat the chronic epidemic of home accidents as a public health problem demanding public education will start in New York City today under the collective auspices of the Department of Health, Greater New York Safety Council, and National Safety Council.

Public health officers, nurses, sanitary and food inspectors, and members of the staff of the Visiting Nurses Association, with others regularly contacting homes throughout the city, will attend the first of a series of ten teacher-training lectures on home safety to be given in twenty city health centers. The lectures will comprise an organized in-service training course continuing until June 9.

The first lectures were held at the Lower West Side Health Center, Manhattan, and in Jamaica Health Center, Queens. Initial lectures were given in eighteen other city health centers in March. The lectures were given weekly thereafter, with district health officers presiding at the meetings in their

The lectures, with visual demonstrations of home accident causes and methods of prevention, were developed and a teaching staff of about forty recruited, organized, and trained by the Greater New York Safety Council. The Council committee in charge is composed of W. Graham Cole, Chairman, Carroll E. Mealey, Dr. Herbert J. Stack, Roger Williams, Julien Harvey, Savel Zimand, and Paul F. Stricker.

Classroom and teaching facilities were provided by the Department of Health under the personal direction of the Commissioner of Health, Dr. Ernest L. Stebbins. Administration of the course is in charge of Mr. Cole, representing the Council, and Mr.

Zimand, of the Health Department.

The undertaking was financed by the National Safety Council in the expectation it will develop a pattern of effective home accident prevention methods which subsequently may be used throughout the United States.

Speakers in the course are representatives of

### INTOCOSTRIN\*

(Squibb Standardized Extract of Curare)

More than 50,000 injections of Intocostrin have been given A very clear appraisal has been made of the remarkably uniform response obtained on its administration to human beings Supplied in 5 cc rubber capped vials, containing the equivalent of 100 mg of standard curare, more than sufficient for one injection

After extensive laboratory studies and several years of clinical investigation the Squibb Laboratories offer Intocostrin—a uniform, physiologically standardized preparation of curare.

### **Useful in Several Clinical Fields**

In Shock Therapy of Mental Disease: Intocostrin, administered intravenously, prior to convulsive shock therapy almost completely eliminates the hazards by "softening" the convulsions.

In Spastic Disorders: Intocostrin, intramuscularly, produces significant and sustained muscular relaxation in many spastic states, reducing or eliminating athetoid movements over a period of many hours

As a Diagnostic Agent in Myasthenia Gravis: Intocostrin in small doses accentuates symptoms in myasthenic patients—a most certain diagnostic procedure for this disease.

\* Intocostrin (Reg. U. S. Pat. Off.) is a trade mark of E. R. Squibb & Sons

organizations such as American Red Cross, Good Housekeeping Institute, New York Fire Department, Center for Safety Education, National Conservation Bureau, and of public utility and insurance companies.

Explaining the difficulties encountered in combating home accidents, which are six times more numerous than industrial accidents. Dr. Stebbins "Education of the public appears to be as necessary in preventing home accidents as in preventing disease. Until now we have made constructive progress in preventing accidents in industrial plants, in construction work, and in traffic, but we have never been able to reach into the home, the most dangerous place of all. Since the Department of Health has many contacts with homes, and reaches many city families, we believe we can teach people to make their homes safe in the same way we are teaching them to make their homes healthful."

Preliminary 1943 reports of the Health Department of N.Y.C. show that of 3,732 New Yorkers who met accidental death, 1,847 were killed in their own homes. More than 1,100 died after falls, 321 after absorption of poisonous gases, and 205 from

burns and explosions.

### Health Workers Now Subject to W.M.C. **Employment Stabilization Program**

The War Manpower Commission, Washington, has announced that physicians, dentists, veteri-narians, sanitary engineers, and nurses who are salaried employees in essential or locally needed activities are hereafter subject to the same provisions of any employment stabilization program as applies to other workers in such activities. Such professional employees may not change their jobs without securing statements of availability from the U.S. Employment Service or being referred to new jobs by this Service. It is understood that the U.S.E.S. will make referrals of such employees only after consulting the state chairman of the Pro-curement and Assignment Service. The W.M.C. state directors may delegate the duty of referring such employees to new jobs to the state and local offices of the Procurement and Assignment Service if this delegation is approved by the regional W.M.C. director.

### Narcotic "Don'ts" for the Pharmacist

Don't leave prescription pads around. Caution the doctors you supply. Addicts want them for effecting narcotic forgeries.

Don't leave narcotics exposed near your wrapping counter. Drugs disappear this way. Check receipts

on your order forms.

Don't accept a narcotic prescription written in pencil. It is not a valid order even when written by

a physician.

Don't fail to scrutinize prescriptions when written thus: Morph. HT ½ ‡ X or Morph. HT ¼ ‡ 10. Several X's or zeros can be added to raise amounts.

Spelling or brackets obviate this possibility.

Don't carry a large-stock of narcotics. Only a three months' supply is good practice. Addicts are breaking into pharmacies and hospitals to get their

drug needs.

Don't leave the key inserted in the lock of your narcotic cabinet. Keep cabinet locked. Make it harder to effect robberies. Keep excess stock in a safe if possible.

Don't place your narcotic stock where it is accessible to others. Avoid storage near sink or toilet.

Customers may ask to use these.

Don't leave anyone alone in the back of your store if you can avoid it. Cabinets have been pilfered this way. Addicts pose as salesmen or ask to use your back room.

Don't become rattled by a rush request to fill a narcotic prescription. Claim for emergency use may be made to create confusion and pass a forgery.

Don't be taken in by a person wearing a white uniform presenting a narcotic prescription. Addicts have posed as nurses to mislead pharmacists and place them off guard.

Don't fill telephone orders for narcotics unless you are assured that prescription will be available upon delivery. Bogus doctor calls are made to effect delivery to addicts. Watch change racket along with this method.

Don't fill prescriptions for unusual quantities of narcotics unless checked with physician. Diversion to addicts is a profitable business, as much as \$1 for

1/4 grain MS

Don't refill narcotic prescriptions without getting new prescription. Fairly large shortages eventually occur through this practice.

Don't hesitate to call the physician about a narcotic prescription you may be questioning. The pharmacist is held responsible for filling forgeries. The doctor's cooperation should be sought.

Don't supply a doctor with his office narcotic needs on a prescription blank (except solutions on order forms). The law requires him to use an Official Order Form filled by a wholesaler.

Don't dispense any exempt narcotics without keeping a record. You must account for the distri-

bution of your purchases.

Don't break the law to accommodate others or for business expediency. Explain the regulations. The customer or physician will cooperate if he sees the point.

Don't hesitate to call this Bureau to get or give information. It will be held strictly confidential. New York State Narcotic Control Bureau: Albany Area—1500 State Office Bldg., Albany; New York City—546 State Office Bldg., N.Y.C.; Buffalo Area—403 State Office Bldg., Buffalo; Syracuse Area—411 Herald Building, Syracuse.

### New Locations of Department Offices Recently Moved

The offices of several units of the State Department of Health in Albany were moved recently and are now located in new quarters, noted below for the convenience of those who may have occasion to visit the staff members concerned.

The - Iministrative unit comprising the Office of Division of Malernity, and the Division of MedicaInfancy, Orthopedics is now housed in the Bond Building,

74-76 State Street, as follows:

Office of Medical Administration, eighth floor—Dr. Edward S. Rogers, assistant commissioner; Division of Maternity, Infancy and Child Hygiene, eighth floor—Dr. Elizabeth M. Gardiner, director; Bureau of Oral Hygiene, ninth floor—Dr. David B. Ast, assistant director; Emergency Maternity and Infant Care Bureau, ninth floor—Dr. Edward B. Bukowski acting director: Division of Orthogodies. Bukowski, acting director; Division of Orthopaedics, eighth floor—Dr. Eugene B. Wilson, assistant director.

[Continued on page 1158]

# OBJECTIVE

REDUCTION OF FEMALE ABSENTEEISM

Statistics show that women absent themselves from work much more often than men; indeed, such absenteeism is said to be 50 per cent<sup>1</sup> higher among women.

Though available data do not clearly assign the responsibility for this marked differential, obviously menstrual inconveniences account for a considerable proportion of the days lost.

On this point Pommerenke<sup>2</sup> recently made the following observation before the American Association of Industrial Physicians and Surgeons: "With a better understanding of the purpose and nature of menstruation, and its recognition as physiological rather than as a pathological process, many a woman may be re-educated and come to regard the so-called difficult days as days in which she need not seriously curtail her usual activities."

Many physicians have discovered the contribution which improved menstrual hygiene (as with the intravaginal tampon Tampax) affords this reeducation process—since it provides such a welcome sense of security, freedom and poise by relieving the physical distress and emotional uncertainty caused by vulval irritation from perineal pads, or from olfactory offense, or conspicuous bulging under slacks or coveralls.

Tampax can be used easily and safely—it will not irritate delicate tissues nor block the flow. And its three different absorbencies permit individual regulation depending upon daily needs. Compressed into a one-time-use applicator, it may be inserted and removed simply and daintily.

Your patients should be grateful to you for recommending Tampax—and (in many cases) it may enable them to stay "on the job" where they are so vitally needed.

The Division of Cancer Control, Dr. Louis C. Kress, director, and the Division of Public Health Education, Burt R. Rickards, director' have quarters in the New York State Teachers, Association Building, 152 Washington Avenue.

The Bureau of Narcotic Control, Ralph M. Wy-

man, acting supervisor, has been moved to the

fifteenth floor of the State Office Building.

The work of the Bureau of Pneumonia Control, formerly under the direction of the Assistant Commissioner for Medical Administration, has been reintegrated with that of the Division of Communicable Diseases and space allotted to its staff on the fifteenth floor of the State Office Building.

### STUDIES OF ALCOHOLISM IN NEW YORK COUNTIES

The Buffalo Council of Social Agencies has conducted a two-year study of chronic alcoholics in Eric County. The study was concerned with the nature, extent, and cost of alcoholism. Reports on the study included a summary of available treatment methods. The council's findings were distributed to the Board of Supervisors of the county and also to agency executives for use by staff members.

Mr. Elmer J. Tropman is acting executive secretary of the Buffalo Council of Social Agencies, 86 West Chippewa Street, Buffalo.

A Section on the Study of Alcoholism of the Rochester Council of Social Agencies plans an intensive survey of the entire problem in the city and Monroe County, and also hopes to make a hospital

The section is made up of social workers, psychiatrists, clergymen, public welfare officers, veteran rehabilitation workers, and a representative of

Alcoholics Anonymous. Dr. G. Kirby Collier, of Rochester, has been active in these developments.—Bulletin, Research Council on Problems of Alcohol, March, 1944

### TIME BETWEEN TUBERCULOSIS REPORTING AND DEATH

Health News reports that a recent study of tuberculosis case reporting in upstate New York disclosed that during the years 1940-1942 about 21 per cent of the fatalities from all forms of tuberculosis were not reported as cases before death. In addition, about 17 per cent of the total were reported within less than three months before death, and another 6 per cent within three to six months before death. In other words, it was pointed out, about 44 per cent of the deaths either were not re-ported at all during life or were reported a relatively short time before death. In explaining circum-

stances which extenuated this situation, Health News states that in certain instances, for example, tuberculosis, the diagnosis is based only on the necropsy.

In others the deaths are from nonpulmonary forms of the disease, in which there is ordinarily no exposure hazard. Some deaths occur in persons who establish residence in upstate New York a short time before death. Other similar factors may account for some of the late reporting, but they explain only a small proportion, it was stated.—J.A.M.A., March 25, 1944

### "OUOTES"

"FREE ENTERPRISE"—The unquestioned right of every man to work at whatever he wants to: whenever he wants to: for whomever he wants to; at whatever wages he is willing to take. And as long as he doesn't transgress upon the civil, safe, lawful and healthful rights of others no one nor any government shall say him nay. The "jackpot" is his—if he holds the cards.—Gridley Adams, Ven Val. V. V. New York, N. Y.

"PICKING YOUR PAPER"-If you just don't care, you might pick your business magazine because its paper makes the best airplanes. Or if you like games, you might eatch the right one with "Fish Pond." We'd bet you won't... Or, if you've got a leaning for it, pick the magazine with widest margins for doodling. . . But if you're serious about wanting the real leader, and no mistakes, then . . . etc., etc.-Nation's Business adv.

### FOR METAL POLISHING

An easy means of keeping metal objects bright as new, has been described in *The Chemical Formulary*.

The preparation, impregnated into metal polishing cloths, is an excellent aid to keeping metal parts of equipment and appliances bright and clean, with a minimum of exertion.

#### Take:

Α.	Hard soap	5 parts
	Boiling water	35 "
	Glycerine	5 "
В.	Oleic acid	7 parts
	Fine tripoli	35 ` "
C.	Ammonia (0.96)	5 parts
D.	Denatured alcohol	8 parts

Heat solution A and B. Saponify with C. Cool to 40-45° C., and add D. Impregnate suitable cloths at 40-45° C., permit to dry, and dust out gently before packing.

### MT. MERCY SANITARIUM

Paper.

Stop Worrying and Get Well. By Edward Podolsky, M.D. Octavo of 124 pages. New York, Bernard Ackerman, Inc., 1914. Cloth, \$2.00.

#### REVIEWED

Internal Medicine in General Practice. By Robert Pratt McCombs, Lt., MC, USNR. Octavo of 694 pages, illustrated. Philadelphia, W. B. Saunders Co., 1943. Cloth, \$7.00.

This volume contains 114 illustrations, numerous tables, and an excellent index. It is closely packed with information vital to the success of the medical student and the general practitioner. Its numerous pointers on symptoms and signs, differential diagnoses, and prognostic and therapeutic indications make it an outstanding book and one that the reviewer can heartily recommend to everyone interested in medicine.

M. A. Rabinowitz

Burma Surgeon. By Gordon S. Seagrave, I.t. Col. (MC), AUS. Octavo of 295 pages, illustrated. W. W. Norton & Co., 1943. Cloth, \$3.00.

This is not essentially a war book, but the delightfully told life of a medical missionary who successfully practiced his dual profession in Burma. He was caught in the advance of the Japanese into Burma and joined in the disastrous retreat under General Stilwell. Dr. Seagrave, a Hopkins man, a son and grandson of missionaries, elected to carry the light of medicine and faith into Burma. Taking his wife, "Tiny," and a basket of discarded instru-

[Continued on page 1163]

[Continued from page 1160]

ments, he practiced medicine and surgery, trained an unusually efficient corps of nurses, and made good, in the bargain, as a missionary. His charm of personality and his real medical ability are seen in the incident of the medical officer who battled against being sent to serve with Dr. Seagrave and then battled even harder when told later that he had to leave his assignment with Dr. Seagrave. The story of the loyalty and hardihood of the nurses and their affection for "daddy," as he was called, is interesting reading. Dr. Seagrave is a worthy disciple of Aesculapius, just as good a sky pilot, and he can tell a tale well.

Joseph Raphael

White Blood Cell Differential Tables. By Theodore R. Waugh, M.D. Duodecimo of 126 pages, illustrated. New York, Appleton-Century Co., 1943. Cloth, \$1.60.

The computation of the absolute numbers of the various types of cells encountered in the differential count is ordinarily carried out by multiplying the total number of leukocytes by the percentage of each type. This small volume of tables will be found useful for facilitating such computations. One fine feature of the volume is the discussion of probable error, a question to which too little attention is ordinarily paid.

A. S. WIENER

Proctology. By Sylvan D. Manheim, M.D. Octavo of 137 pages. New York, Oxford University Press, 1943. Cloth, \$2.00.

This outline on proctology probably has its greatest field of usefulness for students whose instructors follow this particular form. There are several points concerning which there is room for disagreement, such as the rotating of certain anoscopes during examination, the value of ether versus spinal anesthesia, the dosage of procaine hydrochloride for anorectal operations, and the treatment of pilonidal cysts.

Several typographical errors occur, which undoubtedly will be corrected in a subsequent edition. See "26-foot catheter" on page 93, and the misspelling of the word pruritus in the index on page 136.

A. W. MARTIN MARINO

Pathological Histology. By Robertson F. Ogilvie, M.D. Second edition. Octavo of 411 pages, illustrated with 235 photomicrographs in color. Baltimore, Williams and Wilkins Co., 1943. Cloth, \$9.00.

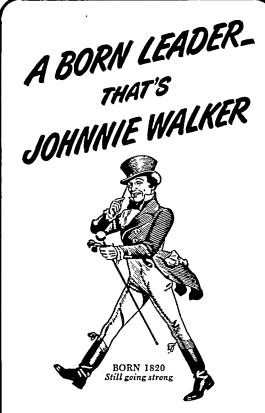

As a companion volume to a standard textbook of pathology the present volume by Ogilvie is excellent. The colored photomicrographs are well chosen and illustrative of the conditions discussed in the texts. The discussions are brief, as would be expected in a book on pathologic histology of only 400 pages. However, an attempt is made to cover in a general way the whole field of pathology. The introductory portions are particularly well illustrated and should be of value to students or to graduates wishing to refresh their knowledge of the subject.

DAVID M. GRAYZEL

Surgical Errors and Safeguards. By Max Thorek, M.D., LL.D. Fourth edition, revised. Quarto of 1,085 pages, illustrated. Philadelphia, J.B. Lippincott Company, 1943. Cloth, \$15.

This edition has been completely rewritten. It contains 1,085 pages with 794 illustrations, many colored. Special attention should be called to the

Care and Feeding of Children. By L. Emmett Holt, M.D. Sixteenth edition. Revised and enlarged by L. Emmett Holt, Jr., M.D. Duodecimo of 321 pages, illustrated. New York, Appleton-Century Co., 1943. Cloth, \$2.00.

A perfect gem of a little book for mothers, this new edition is well illustrated and much new mate-

rial has been added.

During the present crisis every moment of a doctor's time is invaluable. The young mother can resort to this book for help with many of her un-answered questions. The chapter on behavior problems and allergy are particularly helpful.

Inasmuch as so many women with young infants are traveling over the country following their lusbands to camp, this book can be especially recommended to them to aid them in solving their many problems.

THURMAN B. GIVAN

Oral Pathology. A Histological, Roentgenological, and Clinical Study of the Diseases of the Teeth, Jaws, and Mouth. By Kurt H. Thoma, DMD Second edition. Quarto of 1328 pages, illustrated St. Louis, C. V. Mosby Co., 1944. Cloth, \$15.

The second edition of this fine book was necessitated by the rapidity with which the dental profesion depleted the first edition.

In the preface of the second edition Dr. Thoma stes: "The text has been reviewed and additions made to include a few of the rarer diseases that were omitted from the first edition and to bring the book up to date. A number of new illustrations have been added and others have been replaced."

LAWRENCE J. DUNN

Are You Atlergic? By Jessamine Hilliard and Charles C. Coghian, M.D. Octavo of 248 pages New York, M. Barrows & Co., Inc., 1943. Cloth, \$2.50

This is another book on allergy written in an entertaining manner and intended primarily for the layman. The text, although free of heavy medical terminology, does include many old and recent experimental studies in the field of allergy. The chapters on controversial subjects, e.g., the allergic nature of stomach ulcers, acne, granulocytopenia, and seasickness could have been omitted from this book.

It can, however, be recommended as an addition to those available for the allergic patient.

MAX HARTEN

The Medical Clinics of North America. January, 1944. (Chicago Number.) Illustrated. Philadelphia, W. B. Saunders Company, 1944. Published bimonthly (six numbers a year). Cloth, \$15 net; Paper, \$12 net. 1944.

This volume of the Clinics is devoted chiefly to heart disease and disorders of the blood-forming organs. N. C. Gilbert has a useful summary of the treatment of coronary thrombosis. He speaks lavorably of the action of atropine in the early management of these cases. Maher has a good paper on hypertension and Sutton a brief résumé of mitral stenosis. Brief consideration is also given to aneurysm of the aorta (syphilitic and dissecting), heart block, and congenital lesions.

In the symposium on disorders of the blood, Davidson has a long and useful paper on the Rh factor. Isaacs has a fine account of Hodgkin's disease, listing the many symptoms which arise from enlargement of lymphoid structures through-

out the body.

A. BABET

## Blakiston Books-

 Recent Advances in Medicine

11th Edition By G. E. Beaumont, Middlesey Hospital and

E. C. Dodds, University of London

Many important advances in routine clinical and laboratory methods of investigation of disease and in certain forms of treatment are included in this edition. Among many other additions are new and expanded chapters on the sulphonamide drugs, vitamins, and a special article on Penicillin. 43 Illus. 412 Pages. \$5.50.

### Recent Advances in Pathology

4th Edition, By G. Hadfield and Lawrence P. Garrod, University of London

Extensive research of the last few years has been fruitful in the field of pathology. In this edition, new chapters on inflammation, vitamin deficiency diseases and essential hypertension are presented. Other new material includes: crush syndrome, extra-renal azotemia, ductless glands, rheumatic fever, cancer, pathogenesis of pneumonia, regional ileitis, lipoid pneumonia, bronchial adenoma, pvelonephritis. 35 Illus. 346 Pages. \$5.51.

#### THE BLAKISTON COMPANY

PHILADELPHIA 5, PA.

#### SYLVAN BATHS?

"STANGER" galvanic medicated baths are recommended by various authorities in the treatment of exudative inflammations involving the joints, ligaments and tendons, such as bursitis, fibrositis, ankylosis, gout, etc. The baths stimulate the skin and improve the circulation through their hydrocataphoretic action, thereby accelerating metabolism eliminating waste products.

> SULFANILAMIDE IN SOLUTION

• Surbyl is a balanced com-bination of Sulfanilamide, Urea and Benzyl Alcohol in a Propylene Glycol base.

pioneered by

STRASENBURGH

Research

\*

Surbyl has been found valuable in the treatment of otitis media, paronychia, varicose ulcers, infections of the hand or foot and as a dressing for wounds and abscesses.

Surbyl Solution is free from excess alkalinity. The pH is between 7.5 and 8.0 which is a desirable range for topical administration.

Available in pint and gallon quantities. Write for professional folder S-12.

STRASENBURGH ( RMACEUTICAL CHEMISTS SINCE 1886 ROCHESTER, NEW YORK

[Continued from page 1163]

chapter on blood transfusions and to the new chapters on errors and safeguards in plastic operations, electrosurgical operations, and medical-legal aspects of surgical practice. This last addition by Dr. Hubert W. Smith of Harvard University may be read by all surgeons with great interest and profit. He has compressed much valuable information into a small space.

HENRY F. GRAHAM

The Dysenteric Disorders. The Diagnosis and Treatment of Dysentery, Sprue, Colitis, and Other Diarrheas in General Practice. By Sir Philip Manson-Bahr, M.D. Second edition. With an appendix by W. John Muggleton. Octavo of 629 pages, illustrated, including 9 color plates. Baltimore, Williams & Wilkins Co., 1943. Cloth, \$10.

An authority of thirty years' standing offers valuable information on dysentery in a form quickly available to those, both in the armed forces and in civilian practice, who will meet this condition more and more frequently as the present world conflict proceeds.

Differential diagnosis is emphasized: bacillary, protozoal, and helminthic types and treatments are categorically described and evaluated. Improvements in treatment are mentioned, especially the use of sulfaguanidine in bacillary dysentery, and the recent advance in the knowledge of the nutritional diarrheas provides very profitable discussion of the sprue syndrome.

A satisfactory summary of the subject "ulcerative colitis" presents in convenient form the known facts regarding the handling of this disease.

This is a revised edition of an authoritative text on

the dysenteries, first published in 1939.

HENRY F. KRAMER

Methods of Treatment. By Logan Clendening, M.D., and Edward H. Hashinger, M.D. Eighth edition. Octavo of 1,033 pages, illustrated. St. Louis, C. V. Mosby Co., 1943. Cloth, \$10.

The eighth edition of Dr. Clendening's book retains all of the good features and some of the defects of previous editions. The author's inimitable style is in evidence throughout, never showing to better advantage than in the little anecdote about Lady

Webster on page 149. The advice given is always sensible and practical but it is somewhat too comprehensive and uncriti-For example, silver nitrate is mentioned in the treatment of gastric ulcer and its dosage given without comment on its efficacy. Insufficient warning is given against the use of morphine in asthma. The discussion of psychoneuroses is insufficient and sketchy. The classification of nephritis is obsolete and the therapeutic suggestions limited.

The book therefore must be given qualified approval. Much of the material and most of the illustrations are excellent.

MILTON PLOTZ

The Modern Management of Colitis. By J. Arnold Bargen, M.D. Octavo of 322 pages, illustrated. Springfield, Ill., Charles C Thomas, 1943. Cloth, \$7.00.

From a vast experience of study and research done with great detail and care, Dr. Bargen has written a book which is invaluable to anyone interested in the subject of colitis. In clear style, with thoroughness, he has covered the clinical and pathologic phases of this difficult and complex subject in fine style. ject in fine style.

BENJAMIN M. BERNSTEIN

#### FISH VIA CESARIAN BIRTH

The New York Zoological Society reports having succeeded in raising Cesarian-born fishes to maturity (at four months of age) under completely terile conditions.

Even though the fishes died, their bodies did not decompose (because of the absence of bacteria).

#### CAMOUFLAGE COMESTICS

The cosmetic industry has dedicated it's genius to producing camouflage creams for use of troops in jungle fighting.

Many firms in the industry are now manufacturing sunburn preventives for soldiers, sailors and fliers; insect repellents, chap sticks and creams and powders for soldiers use in comforting aching feet

#### WHY SHOE RATIONING?

The April, No. 18 stampede for shoes provides some interesting highlights on the reason why shoes must be rationed during the war.

During the last two weeks in April as consumers rushed to cash in on their No. 18 stamps from Ration Book No. 1, shoe sales jumped tremendously. As the closing hours approached, shoe men estimated that almost 1,300,000 of the No. 18 stamps were still uncashed. Seven weeks earlier the number still unused were estimated at 7,800,000.

The Office of Price Administration reveals that distribution of rationed shoes in 1943 exceeded production by more than 53,000,000 pairs.

"This heavy drain on inventories," it declared. "clearly demonstrates why it has been necessary to decrease the rate of shoe rationing to civilians."

"SHADOW PICTURES"-Before the turn of the century when present-day values of the X-Ray were still undreamed of, there were many wild theories of what the rays could accomplish. Some thought they would reveal the soul and silence the skeptics. Members of the W.C.T.U. were sure that the ravages of alcohol on the body would become so apparent that all drunkards would scurry to climb aboard the water wagon.

ın whooping cough

## Elixir Bromaurate

GIVES EXCELLENT RESULTS

Cuts short the period of the illness and relieves the distressing spasmodic cough. Also valuable to other Periistent Coughs and in Bronchilis and Bronchile Ashme. In four-cunes original bottles. A teaspoonful every 3 to 4 hrs.

Cal-C-Tose 'Roche'—a happy solution for the finicky, undernourished patient who cannot take tablets or capsules or who has grown tired of plain milk. al-C-Tose contains generous amounts of vitamins A,  $B_1$ ,  $B_2$ , C, and D plus

alcium and phosphorus, in an appetizing cocoa-malt base. Two heaping aspoonfuls mixed with warm or cold milk makes a delicious "hot chocolate" refreshing "milkshake." Supplied in 12-oz and 5-lb containers . . . .

FFMANN-LA ROCHE, INC. • ROCHE PARK • NUTLEY 10 • NEW JERSEY

ROCHE PRODUCTS ARE NEVER ADVERTISED TO THE LAITY.

GAL-G-TOSE 'ROGHE'

HETHER you buy medical equipment for private practice or for a hospital, always it is with the hope that time and experience will prove that you correctly judged its value.

Your investigation of variously offered products is, of course, primarily in view of determining which offers most toward helping to render a better service to patients; price alone is not your determining factor, as with ordinary commodities.

If you haven't had experience with G-E x-ray or electromedical equipment, you'll not take for granted that it is of the fine quality you are looking for. But to countless thousands of other physicians, hospitals, and clinics, the world over, equipment bearing the trademark is accepted without question, because they have learned from experience that in all G-E equipment this desired fine quality is inherent.

This reputation for inherent fine quality has been earned the hard way—by strict adherance to definitely established policies and ideals throughout a half-century of service to the profession. And it perhaps best explains why a G-E apparatus, wherever it may be used—in physicians' offices, or in civilian or military hospitals, in any and all climes—always can be relied upon to give the eminently satisfactory service that characterizes all G-E products.

Though your plans for buying an x-ray or electromedical apparatus may be yet rather indefinite, may we suggest that in the meantime you obtain further information through our local representative, whose branch office address we will be glad to send you. Address Dept. C15.

# A NEW AND EFFECTIVE CONTROL OF Fungous Infections

TRICHOPHYTON

From extensive medical and dermatological research, an effective agent has been developed which prevents the growth of pathogenic fungi. This is Sopronol.

By approaching the problem of mycoses elimination on a fungistatic rather than a fungicidal basis, it was found that sodium propionate is a remarkable fungistat with low toxicity. This drug was made the chemical basis of Sopronol. Clinical experience shows that Sopronol inhibits fungous development, stopping the growth and spread of the infection, and the causative organism soon dies. These results are obtained without the untoward side reactions such as are customarily produced by the fungus in contact with fungicides.

#### ALL SUPERFICIAL MYCOTIC INFECTIONS

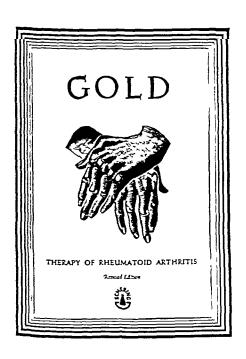

Prescribe Sopronol for: Tinea Pedis, Tinea Cruris, Tinea Capitis, Tinea Glabrosa, due to "the dermatophytes"—Trichophyton, Epidermophyton, Microsporum Candida, and pathogenic aspergillae infections. Sopronol is non-irritating, non-keratolytic, non-toxic.

Available in alcoholic solution, powder and water soluble ointment bases.

## IN PANCREATIC DYSFUNCTION

is a brand of extract of whole pancreas. It contains all of the enzymes normally present in the gland, together with the coexistent organic and inorganic constituents.

HOLADIN is indicated as replacement therapy in conditions associated with deficient pancreatic secretion, and as an aid in the digestion of carbohydrates and fats.

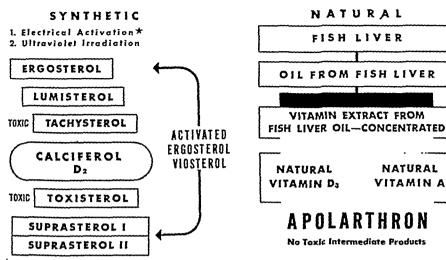

#### THE SICK FOR THE NUTRITION OF

is a concentrate of the proteins of fresh beef and the entire wheat berry in an agreeable menstruum. It is helpful during acute

illness, in convalescence, and in cases where ordinary food

is not acceptable. Originated and Made by FAIRCHILD BROS. & FOSTER, New York 13, N. Y. The Fairchild Buildings

#### VITAMIN D

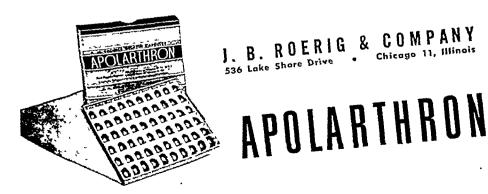

<sup>\*</sup>Electrically activated ergosterol is a complex mixture of undetermined composition

# Natural Vitamins

## FOR GREATER SAFETY IN ANTARTHRITIC THERAPY

The usefulness of high-dosage vitamin D therapy in arthritis is well established. One limitation imposed upon it, when activated ergosterol is used, are the toxic reactions so frequently encountered. Apparently these are due to toxic by-products, the development of which cannot be avoided in manufacture.

Apolarthron, the only preparation making natural vitamins available for massive dosage treatment with vitamin D. has amply demonstrated the greater safety of the natural vitamins. Tachysterol and toxisterol, the toxic by-products of ergosterol activation, have never been found in the fish liver oils from which Apolarthron is obtained. Each capsule contains 25,000 U.S.P. units of natural vitamin D and 30,000 U.S.P. units natural A. Clinically the claim has been advanced that the presence of vitamin A apparently lowers the amount of vitamin D required.

## for Better Utilization of the

PRESENT-DAY DIETARY

Lessened food availability, rationing, and increased carbohydrate consumption, in many instances have taken the dietary far from what might be called optimum. Not only to assure better utilization of the present-day dietary, but also to prevent or correct nu-

tritional deficiencies, makes the prescription of B-complex vitamins rational procedure. Noviplex, largely derived from high potency yeast concentrate, provides all the naturally occurring factors of the B-complex, including choline, inositol and biotin.

Each capsule of Noviplex contains:

<u> </u>	
Thiamine hydrochloride	1.0 mg.
Riboflavin	1.0 mg.
Niacinamide	8.0 mg.
Pyridoxine hydrochloride .	
Calcium pantothenate	
plus all other factors naturall	yoccurring
in yeast concentrate. Novig	olex is sup-
plied in bottles of 100 and 50	00 capsules.

## Effective Convenient Economical

THE effectiveness of Mercurochrome has been demonstrated by more than twenty years of extensive clinical use. For professional convenience Mercurochrome is supplied in four forms—Aqueous Solution in Applicator Bottles for the treatment of minor wounds, Surgical Solution for preoperative skin disinfection, Tablets and Powder from which solutions of any desired concentration may readily be prepared.

## Mercurochrome

(H. W. & D brand of merbromm, dibromoxymercurifluorescein-sodium)

is economical because stock solutions may be dispensed quickly and at low cost. Stock solutions keep indefinitely.

Mercurochrome is antiseptic and relatively non-irritating and non-toxic in wounds.

Complete literature will be furnished on request.

HYNSON, WESTCOTT & DUNNING, INC. BALTIMORE, MARYLAND

#### IODINE

#### ...a versatile germicide

★ Iodine is outstanding in its usefulness and efficiency as a germicide.

It is relied upon for pre-operative skin disinfection and for wound therapy. It is of service in the treatment of skin infections and parasitic skin diseases due to fungi. It has great value in the sterilization of cuts, bruises and abrasions.

The value of Iodine as an antiseptic is increased by the clinically demonstrated fact that it is bactericidal in concentrations which are not toxic to the tissues.

Iodine Educational Bureau, Inc. 120 Broadway, New York 5, N. Y.

## PENICILIN MERCK

#### A RECORD OF PERFORMANCE

Thoroughgoing experience and established leadership in organic research, development, and production have been the determining factors in the rapid achievement of large-scale Penicillin production by Merck & Co., Inc.

Intensive research on Penicillin, begun in the autumn of 1940, established a sound basis for the successful development of mass production. By applying chemical engineering principles to the manufacture of this intrinsically unstable and difficultly produced substance, Merck & Co., Inc. succeeded in devising and perfecting a practical method of production, based on the mass-fermentation principle.

The following chronologic review tabulates the more important advances leading to the present volume of Penicillin production, including some of the contributions that we have been privileged to make:

1929-Penicillin discovered by Fleming in England.

1932-First report by British investigators confirming original work on Penicillin.

1940—First isolation of solid Penicillin by Oxford investigators.

1940—Merck research on antibiotics concentrated on Penicillin.

1941-First report of Penicillin's clinical value.

1941—Prof. H. W. Florey and Dr. N. G. Heatley, of the Oxford group, visited the United States to confer with interested Government officials and manufacturers, with the objective of establishing Penicillin production in America.

1941—Dr. Heatley, who participated in the first production work in England, remained at the Merck Research Laboratories to collaborate with Merck chemists in developing test and production procedures.

1941—Merck brought about a reciprocal arrangement between British and American investigators to spur production in cooperation with the United States and British governments.

1942—Merck supplied Penicillin for first case of bacteriemia successfully treated with Penicillin in America.

1942—Merck Penicillin was rushed under police escort to Boston for treatment of the Cocoanut Grove fire casualties.

1943—Merck sent supplies of Penicillin to England by air transport for urgent therapeutic use by the United States Army Medical Corps.

1943—Large-scale production of Penicillin was established by Merck to meet Government requirements.

1944—Merck sends ever-increasing supplies of Penicillin to our Armed Forces.

Merck & Co., Inc. will continue to surpass present production records, with the urgent objective of supplying adequate quantities of Penicillin for civilian use, as soon as the essential requirements of our Armed Forces have been fulfilled.

MERCK & CO., Inc. Manufacturing Chemists RAHWAY, N. J.

## Effective Convenient Economical

THE effectiveness of Mercurochrome has been demonstrated by more than twenty years of extensive clinical use. For professional convenience Mercurochrome is supplied in four forms—Aqueous Solution in Applicator Bottles for the treatment of minor wounds, Surgical Solution for preoperative skin disinfection, Tablets and Powder from which solutions of any desired concentration may readily be prepared.

## Mercurochrome

(H. W. & D. brand of merbromin, dibromoxymercurifluorescein-sodium)

is economical because stock solutions may be dispensed quickly and at low cost. Stock solutions keep indefinitely.

Mercurochrome is antiseptic and relatively non-irritating and non-toxic in wounds.

Complete literature will be furnished on request.

HYNSON, WESTCOTT & DUNNING, INC. BALTIMORE, MARYLAND

#### IODINE

#### ...a versatile germicide

★ Iodine is outstanding in its usefulness and efficiency as a germicide.

It is relied upon for pre-operative skin disinfection and for wound therapy. It is of service in the treatment of skin infections and parasitic skin diseases due to fungi. It has great value in the sterilization of cuts, bruises and abrasions.

The value of Iodine as an antiseptic is increased by the clinically demonstrated fact that it is bactericidal in concentrations which are not toxic to the tissues.

Iodine Educational Bureau, Inc. 120 Broadway, New York 5, N. Y.

### IN IMPAIRED FAT DIGESTION

Degalol, the original chemically pure deoxycholic acid, is the constituent of human bile which is chiefly concerned with the emulsification of ingested fats.

When bile secretion is deficient, or totally lacking as in biliary fistula, the administration of Degalol assures not only digestion and absorption of food fats but also of the fatsoluble vitamins A, D, E, and K.

When fatty foods prove intolerable in the absence of cholecystic pathology, Degalol usually relieves the postprandial distress and permits of liberalization of the diet.

Supplied in boxes of 100 1½ grain tablets.

Riedel - de Haen, Inc., New York 13, N. Y.

# Basically Souna

THE prompt restoration of health in individuals suffering from deficiency of the water-soluble vitamins is facilitated by the following measures:

- 1. Early and accurate diagnosis.
- 2. A nutritionally rich diet.
- 3. Supplementation of the diet with BASIC FORMULA VITAMIN TABLETS SQUIBB
- 4. Augmentation of the intake of B-Complex factors with dried brewer's yeast, yeast concentrate or oral liver extract.

The composition of Basic Formula Vitamin Tablets Squibb is as follows:

10 mg. Thiamine Hydrochloride

5 mg. Riboflavîn

50 mg. Niacinamide

75 mg. Ascorbic Acid

BASIC FORMULA has a background of proved clinical value—in Birmingham, Alabama, and in New York City. This is the "basic formula" used by Dr. Norman Jolliffe and Dr. Tom D. Spies, and described by the latter in his study on the nutritional rehabilitation of 100 American workers for industry.

Do as many nutrition experts do — use Basic Formula in treating deficiencies of

water-soluble vitamins. Ample supplies are now available. A recent reduction in price has lowered the cost more than one-third. Remember, Basic Formula Vitamin Tablets Squibb represent the exact composition of the "basic formula" many experts have used and recommended. It is best, however, to specify "SQUIBB" in ordering to be sure your patient receives the original effective formula.

The treatment of arthritis as a systemic disease requires comprehensive and collaborated therapeutic endeavors.

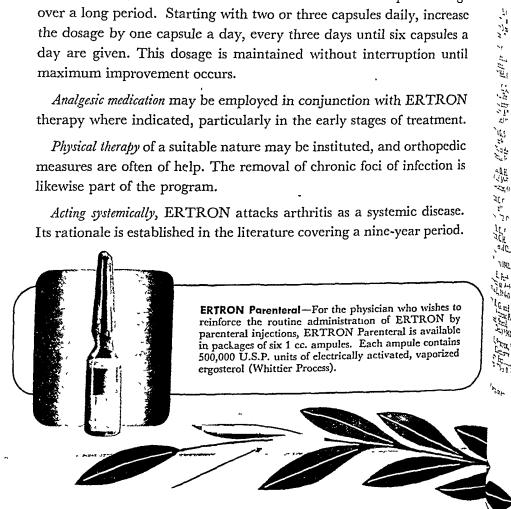

With ERTRON therapy, intensive dosage-Ertronization-is recommended in order to derive optimum benefit.

To Entronize, ERTRON must be administered in adequate dosage over a long period. Starting with two or three capsules daily, increase the dosage by one capsule a day, every three days until six capsules a day are given. This dosage is maintained without interruption until maximum improvement occurs.

Analgesic medication may be employed in conjunction with ERTRON therapy where indicated, particularly in the early stages of treatment.

Physical therapy of a suitable nature may be instituted, and orthopedic measures are often of help. The removal of chronic foci of infection is likewise part of the program.

Acting systemically, ERTRON attacks arthritis as a systemic disease. Its rationale is established in the literature covering a nine-year period.

# An Achievement in PROTECTION AGAINST CONTAMINATION

is b

1—Instead of the two-liter flasks in which penicillin ordinarily is made by "surface culture," Penicillin-C.S.C. is made in a battery of giant tanks, each of 12,000 gallon capacity, by "submerged culture," an operation of vastly increased sensitivity, calling for the utmost in care and control. 2—Vial-filling; note the safeguards against contamination. 3—Cold room, where Penicillin-C.S.C. is frozen prior to vacuum-drying.

4—The "last word" in controlled vacuum-drying equipment. The number of these evaporators indicates the magnitude of Penicillin-C.S.C. production. 5—Vial-sealing and capping.

Walls of highly polished opal glass and translucent glass brick, and rounded wall, floor and ceiling abutments, permitting of maximum cleanliness—

air-conditioning that controls temperature, humidity,

and particle content-

sterilizing lamps that destroy air-borne microorganisms—

sterilizing-lamp-controlled "locks" that prevent undue airflow from room to room-

sterile clothing (masks, gowns, shoes, gloves) worn by all technicians—

facial shields which carry the technician's breath away from the work area-

these are but a partial list of the safeguards employed in the "sterile area" of the Penicillin-C.S.C. plant.

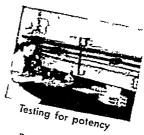

Out of its quarter-century of research and experience in microbiotic production, Commercial Solvents Corporation has developed not only these safeguards, but also the "submerged culture" method which produces Penicillin-C.S.C. in giant three-story tanks.

This combination of mass production methods, skilled personnel, the utmost in safeguards, and unremitting laboratory control spells two assurances—

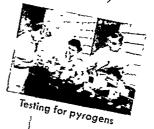

Penicillin-C.S.C. will always be of dependable potency,

sterility, and pyrogen-freedom-

Penicillin-C.S.C., though now allocated as the armed forces direct, will be available in adequate distribution throughout the United States as soon as released.

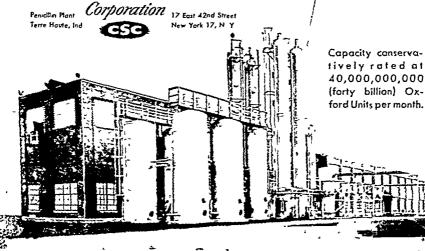

PHARMACEUTICAL DIVISION

COMMERCIAL SOLVENTS

Crystals often possess great beauty, but in delicate renal tubules they can be as damaging as powdered glass, as obstructive as hydrargyrism.

During sulfonamide therapy the dangers of crystalluria may be effectively diminished by administration of 'Alka-Zane'\* Alkaline Effervescent Compound which raises urinary pH and thereby helps bring sulfonamides safely through the kidney, in solution. Sulfonamides may be ten times more soluble in alkaline urine than in acid urine.

'Alka-Zane' Alkaline Effervescent Compound makes a refreshing, effervescent drink, increases sulfonamide solubility and fluid intake, and provides calcium glycerophosphate, magnesium phosphate, calcium phosphate, potassium bicarbonate, sodium bicarbonate and sodium citrate.... William R. Warner & Co., Inc., 113 West 18th Street, New York 11, N. Y.

TO PROVIDE more effective relief in hemorrhoids and other painful anorectal conditions, two topical anesthetics are incorporated in Diothoid Suppositories.

One of these is rapid in action and transient in effect—the other, slowly absorbed and prolonged in effect. Because of this blended anesthetic action, Diothoid Suppositories relieve pain quickly and keep the patient comfortable over a long period of time.

#### DIOTHOID

BRAND Anesthetic and Antiseptic

#### **SUPPOSITORIES**

SPECIAL HYDROPHILIC BASE. The Diothoid base, an exclusive Merrell development, causes the suppository to swell by absorption of water and conform to the shape of the lower rectum. Being miscible with mucous and serous secretions, it forms a self-emulsified ointment that remains in intimate contact with surrounding parts. There is no leakage from the anus.

OTHER ADVANTAGES. Healing of local anal lesions is encouraged by urea contained in Diothoid Suppositories. They are antiseptic, decongestive, free from narcotics, and correctly designed for easy insertion.

#### Nurses for the Armed Forces

Nursing care for the men in the armed forces must be plentiful and of the highest quality obtainable. No compromise with these demands is even thinkable. They must and will be fulfilled.

Since December 24, 1943, the Procureinent and Assignment program for nurses has been in operation in this State. No nurse is now accepted by the Army or Navy without a 1-A clearance from the State Committee.

The sixty-one local Procurement and Assignment Committees, composed of representatives from medical, hospital administrative, and lay groups, review each case after studying the circumstances existing at the agency employing the nurse. Not only does the agency itself submit a report of its nurse personnel, but the advice of the employer or his agent also is sought by the local committee before classifications are made.

The State Procurement and Assignment Committee, with similar representation, reviews the classifications recommended by local committees and makes the final classification. Applications for military service are forwarded by the American Red Cross. All groups or individuals affected by the nurse procurement program in this State are afforded ample opportunity to be heard before final classification is made.

To May 1, 1944, 14,020 nurses had been classified by the State Committee, a truly noteworthy accomplishment. These 14,020 nurses include 4,504 nurses classified 1-A

(under 45 years of age and unmarried) and 702 classified 1-B-1 (under 45 years of age, married, but not maintaining a home with husband; no children). There are, therefore, about 5,206 nurses in the "available" group.

In 1943, 2,638 nurses were assigned to the Army and Navy, 44 per cent of the State's quota of 5,971.

In 1943, 3,000 student nurses graduated. New York State's quota of nurses for the armed forces, for the first half of 1944, is 1,957 nurses. To May 1, 629 had been assigned, leaving a balance of 1,328 still to be recruited by June 30, 1944. But the fact that only one nurse out of ten classified as 1-A is now entering military service is a cause of some concern. Nursing care for the armed forces must not fail.

The State's reserve of 5,206 "available" nurses should be ample to provide the 1,328 necessary to complete the quota for the first half year without unduly depleting nursing service for the civilian hospitals.

Apparently every consideration possible has been given by the State Procurement and Assignment Committee to the reasonable needs of hospitals and other agencies requiring nursing service. Possibly 500 to 700 nurses in the "available" group who have appealed their classifications or whose employers have done so for them will eventually be reclassified. We are informed that "Almost every single hospital in the State reports it has a varying number of formerly inactive nurses back on its staff.

It has volunteer help in almost undreamedof proportions. The entire problem is, of course, complicated by the shortage of all kinds of help and the fact that in almost all hospitals the patient census is higher."

No such vast program of procurement could possibly be conducted as was the case in the procurement of physicians, without in some instances creating a temporary imbalance in a few localities. In the case of the nurses in 1944, as in that of the physicians in 1942 and 1943, such imbalances are being somewhat slowly corrected by replacements from nurses in retirement, and those in the private-duty field. It has been recommended that "married nurses who have been classified as available for military service be reviewed and wherever these nurses are filling essential positions, . . . they be reclassified as essential even though potentially eligible for military service." This will assist in correcting some few instances where it appears too many nurses had been classified as available by local committees.

It has been recommended by the Medical Society of the State of New York that "the component county medical societies give every possible aid to the Procurement and Assignment Committee of the New York State Nursing Council for War Service in working out legally the double task of the State Procurement and Assignment Committee for Nurses in securing nurses for the armed services and in maintaining essential local nurse civilian situations.... To that end the Council urges that the county medical societies encourage visits of representatives of the Nurse Procurement and Assignment Committee as well as conferences with the War Participation Committees of the county societies."

Individual physicians can assist in this vital program of nurse procurement by urging all nurses in the "available" group to respond, and by releasing wherever possible office nurses who can be replaced by secretarial help. We bespeak the assistance of our membership in assuring the success of this program, and in giving the widest possible publicity to the needs of the armed forces for 1-A nurses.

The State of New York has always met and usually has more than met its quotas in every other category—physicians, finance, selective service, volunteer help on the home front, blood banks. Its 1-A nurses will not fail their brothers, husbands, kith and kin, as vast attack, relentless invasion, and wide spread naval operations make more imperative than ever the need for their services.

#### Opportunity for Service

The New York State Guard is seriously in need of medical officers as well as enlisted personnel, medical as well as line. was brought to the attention of the members of the Medical Society of the State of New York at the meeting of its House of Delegates, where it was the subject of a resolution urging every physically qualified physician not over 55 years of age "to apply immediately to his nearest unit of the New York State Guard to ascertain whether or not his services are needed; and....to contact every individual in his territory between the ages of 17 and 55 with the view of urging them to enlist immediately in the Guard for either medical or line-troop duty."

The existence of the New York State Guard is required by the Constitution of the State, and is the first line of defense in any internal disturbance, be it from fifth-column activities or the disasters of nature. The removal of more and more Federal troops from the area of the continental United States increases the importance of the State Guards as a guarantee of the tranquillity of all states, renders their recruitment of all personnel to full strength of first importance, and the maintenance of their health and medical care a responsibility of the physicians of the Empire State.

Medical officers and medical corpsmen of the Guard have this responsibility; they must be well trained and numerically sufficient to discharge their obligations well. Especially is this so during the period of field training and in the period immediately preceding field training when inoculations and vaccinations of Guard personnel must be done. Here is an opportunity for service which should be seized by all physically qualified physicians who can do so. Report to your nearest unit of the New York State Guard now to ascertain whether or not your services are needed.

#### Aerobiology

The decline of air-borne infection has been well documented in a recent monograph. This decline is a merited reward of the heightened insight into the importance of improving hygienic conditions, but by no means connotes the ultimate extinction of air-borne infections. Colds, influenza, and other virus infections carried by the atmosphere are still too much with us. Nor does there seem imminent a sharp decrease in such air-borne diseases as measles, chicken pox, and mumps, which continue to recur in endemic or epidemic form. Such persistent prevalence indicates that many features of this type of infection still await solution. An ingenious study along the lines of aerobiology has recently been reported by one of the pioneers in this field.2 The gist of their thesis is as follows.

Epidemics may be explained by the law of mass action. The parasitic communication between host and victim may be likened to the contact between reacting molecules. Contact is an elemental concept in chemical reactions but in the spread of contagion the behavior of the parasite and the resistance of the host are variable factors. In addition, there may be an intermediate environmental factor, the air. further complicate matters, the existence of an infection may not be clinically apparent, a fact which necessarily impedes the study of epidemic contagion. Nevertheless, it is possible to study the dynamics of contagion experimentally by choosing simple problems.3

Measles, which produces a fairly characteristic picture, is a good subject for such studies. Recovery from the disease produces lasting immunity, with few exceptions, while susceptibility

1 O'Hara, D.: Air-Borne Infection, New York, The Commonwealth Fund, 1943.

2 Wells, W. F., and Wells, W. W. Am. J M. Sc. 206: in the nonimmune is great. Hence, many of the latter group can confidently be expected to contract the disease under conditions of proper exposure.

Susceptible students can be ascertained by the study of carefully kept school records. In classroom investigations, approximately similar numbers were exposed for equal periods. Under favorable circumstances, statistical expression can be given to probability of contact in such air-borne infections. The rate at which the air becomes infected depends upon the rate at which susceptible individuals become infected. rate of removal of infected material in the air depends upon ventilation. Increasing ventilation and decreasing the number of susceptible individuals are the major factors which diminish air-infection. Irradiation of the atmosphere was found to be equivalent to increasing ventilation. Similarly, in a study of mumps at Swarthmore College, change from epidemic to endemic spread of the disease was achieved by decreasing the atmospheric density of susceptibles.

Such mathematical studies offer a technic for evaluating the efficacy of therapeutic measures. From the above it is safe to conclude that airborne infections depend in the main upon a deficiency of air supply per susceptible person. This obviously calls for greater ventilation of crowded rooms and halls, combined with periodic emptying of these rooms, particularly of individuals who are harboring an air-borne microorganism.

Another interesting revelation was that a tenfold increase of winter ventilation may be equivalent to ultraviolet irradiation in controlling the epidemic spread of air-borne contagions. Appreciation of the importance of ventilation combined with the removal of individuals who literally infect the air bids fair to be the foundation of a new branch of medicine-aerobiology.

#### A.M.A. Will Meet in Chicago June 12-16

The ninety-fourth annual session of the American Medical Association will be held in Chicago, June 12-16, 1944.

The House of Delegates will convene at 10:00 A.M. on Monday, June 12. The delegates from New York will be Drs. James R. Reuling, Jr.,

Bayside; Edward R. Cunniffe, New York; William D. Johnson, Batavia; Thomas M. Brennan, Brooklyn; Clarence G. Bandler, New York; Floyd S. Winslow, Rochester; Walter P. Anderton, New York; Oliver W. H. Mitchell, Syracuse; Emily Dunning Barringer, New York:

<sup>11 (</sup>July) 1943.

Smith, T.: Parasitism and Disease, Princeton, Princeton University Press, 1943.

It has volunteer help in almost undreamedof proportions. The entire problem is, of course, complicated by the shortage of all kinds of help and the fact that in almost all hospitals the patient census is higher."

# PROLONGED INTRAVENOUS PENTOTHAL SODIUM ANESTHESIA ESPECIALLY WITH REFERENCE TO ITS APPLICATION TO MILITARY SURGERY

BARNETT A. GREENE, CAPT., (MC), AUS

THE purpose of this paper is to emphasize: (1) the applicability of intravenous pentothal sodium as the primary agent for anesthesia of one hour or more, and (2) its value in military surgery.

Too little emphasis has been placed on its utility in long operations. Almost universally, and even as recently as Beecher's article in the Journal of the American Medical Association, we have been cautioned to use intravenous anesthetics only in short cases, and warned that its use in longer cases is undesirable. It is our belief, however, that the recent gains in knowledge and experience in anesthesiology and the rapidly expanding body of skillful anesthetists make this an opportune and necessary time in our present crisis to reduce the resistance of surgeons and anesthetists to the use of intravenous anesthesia for long cases, especially in military surgery.

We consider intravenous anesthesia to be safely applicable to long surgical procedures, whether they are major or minor, only if relaxation and depth need not be profound. It has been reported as successful for surgery requiring great depth of anesthesia and marked relaxation,2 but we do not consider it as safe as other methods available for such operations, especially in vigorous patients. For prolonged cases requiring little or moderate relaxation, intravenous anesthesia can be as safe as and more practicable than any other method, e.g., surgery of extremities, head, chest wall. From the point of view of the degree of relaxation which can be safely maintained indefinitely with intravenous anesthesia, it should occupy a place between ethylene and cyclopropane. In short, we do not advocate a change in the type of case suitable for intravenous anesthesia, but we do wish to remove the time limit that has been imposed on intravenous anesthesia. Any procedure which, if brief, can best be done under intravenous anesthesia, should and can be given the same type of anesthesia, even though the operation lasts one or eight hours.

#### Review of Literature

Cailleret\* (1931) produced intravenous evipal anesthesia for 200 cases, in some of which the duration was one and a half hours and the maximum dose 1.8 Gm.

Read at the Annual Meeting of the Medical Society of the State of New York, Buffalo, May 4, 1943.

Ragotzky<sup>4</sup> (1933) reported 120 cases of evipal anesthesia chiefly for major operations. The maximum dose was 2 Gm.

Von Sailer<sup>5</sup> (1934) described 120 major operations with evipal anesthesia for one and a half hours, using 3 Gm. at the most.

Decker<sup>6</sup> (1934) gave evipal for 112 cases, chiefly laparotomies, in which the maximum dose was 2 Gm. and the maximum duration was eighty-three minutes.

Jentzen' (1934) described 1,500 cases of evipal anesthesia in which were included major operations over two hours long requiring 4.8 Gm. of evipal.

Lundy<sup>8</sup> (1935) administered pentothal without ill effect, in a brain tumor operation which lasted three and one-half hours.

Maloney<sup>9</sup> (1936) reported 18 cases of intravenous evipal anesthesia of one hour or more; three of these lasted 125, 125, and 133 minutes, respectively. He, however, took the precaution of injecting 2 cc. of a 0.3 per cent picrotoxin solution intramuscularly just before the start of the anesthesia. We do not find this necessary unless the patient arrives in the operating room too depressed by premedication. noted an occasional episode of postoperative restlessness or excitement during recovery, which was easily controlled by morphine sulphate. We, too, have had this type of postoperative experience with pentothal, but these instances have been as uncommon as they are with similar cases of prolonged anesthesia with ether or cyclopropane, and they are just as readily quieted by morphine.

McNelis<sup>10</sup> (1936) reported the use of 4 Gm. of evipal given to a robust patient for an hourlong reduction and application of a spice east for a fractured femur.

Carraway<sup>11</sup> (1938) reported the use of pentothal sodium for a successful prostatic resection lasting two hours and forty-five minutes in a 78year-old man.

Lewis<sup>12</sup> (1938) has claimed that with proper administration, pentothal should be used for operations lasting as long as three hours.

Laquière<sup>13</sup> (1939) presented the result of 2,879 cases of evipal anesthesia, of which more than two-thirds were of moderate or long duration, up to three and one-half hours, using up to 4.6 Gm. evipal.

Albert A. Gartner, Buffalo; Edward C. Podvin, New York; Louis H. Bauer, Hempstead; Thomas A. McGoldrick, Brooklyn; James M. Flynn, Rochester; George W. Kosmak, New York; Louis A. Van Kleeck, Manhasset; John J. Masterson, Brooklyn; F. Leslie Sullivan, Scotia; Walter W. Mott, White Plains; J. Stanley Kenney, New York; and William Hale, Utica.

The sixteen scientific sections of the American Medical Association, the Medical Corps of the Army, the Medical Corps of the Navy, and the Public Health Service are entitled to one delegate each.

The Scientific Assembly of the Association will open with the general meeting, to be held at 8:00 p.m. Tuesday, June 13. The sections will meet on Wednesday, Thursday, and Friday, June 14, 15, and 16, as follows: Convening at 9:00 a.m. will be the sections on practice of medicine; obstetries and gynecology; laryngology, otology,

and rhinology; pathology and physiology; preventive and industrial medicine and public health; urology; orthopaedic surgery; anesthesiology; miscellaneous business—sessions for the general practitioner. Convening at 2:00 p.m. will be the sections on surgery, general and abdominal; ophthalmology; pediatrics; experimental medicine and therapeutics; nervous and mental diseases; dermatology and syphilology; gastroenterology and proctology; and radiology.

The Registration Department, which will be located in the Hotel Stevens, will be open from 8:30 A.M. until 5:30 P.M. Monday, Tuesday, Wednesday, and Thursday, June 12, 13, 14, and 15, and from 8:30 A.M. to 12:00 NOON Friday, June 16.

The official call to meeting, signed by James E. Paullin, President, H. H. Shoulders, Speaker of the House of Delegates, and Olin West, Secretary, appeared in the May 6 issue of the J.A.M.A.

# PROLONGED INTRAVENOUS PENTOTHAL SODIUM ANESTHESIA ESPECIALLY WITH REFERENCE TO ITS APPLICATION TO MILITARY SURGERY

BARNETT A GREENE, CAPT., (MC), AUS

The official call to meeting, signed by James E. Paullin, President, H. II. Shoulders, Speaker of the House of Delegates, and Olin West, Secretary, appeared in the May 6 issue of the J.A.M.A.

were due to (1) failure to respect a contraindication to intravenous anesthesia, or (2) too rapid injection of a relative overdosage, or (3) lack of complete facilities for the treatment of respiratory obstruction or depression.

There is no evidence in the literature which contraindicates the application of intravenous pentothal sodium anesthesia as a primary agent for long cases, under proper safeguards and for suitable operations.

There are many conditions which are only relative contraindications to the use of intravenous anesthesia for short cases—e.g., moderate hepatic damage, shock, lack of all safeguards. These may be overlooked in many short cases without encountering disaster. But for prolonged surgery these and many other conditions must be corrected, compensated for, or treated before or while subjecting the patient to the anesthesia.

There are several abnormalities of physiology,26 such as slight anoxemia, retention of carbon dioxide, mild respiratory obstruction, which may appear during brief intravenous anesthesia without causing complications. They are tolerable only because the brevity of the procedure allows for spontaneous recovery. But in the safe conduct of anesthesia for prolonged operations, there must be more accurate maintenance of normal respiratory and circulatory conditions. Respiration must not be hampered by the slightest degree of obstruction. The respiratory center, to be judged accurately for its true level of depression by the anesthetic, must be kept free from any abnormal stimulating influence such as anoxemia and retained carbon dioxide.26 Allowance must be made for the action on respiration by unavoidable stimuli-e.g., cutaneous reflexes and analeptic drugs required prior to or during anesthesia. In prolonged intravenous anesthesia if anoxemia or hypercapnia is not prevented or cut short, the patient is in danger of sudden severe depression of respiration and circulation by the anoxemia and hypercapnia as they accumulate beyond the level of stimulation and become depressant. Furthermore, the patient will receive an unnecessarily larger dose of pentothal, because the deep respirations will indicate a seemingly lighter plane of anesthesia than is really present. For the same reason we do not advise the use of a respiratory stimulant just before induction, as used by Maloney,9 or during anesthesia, as was once recommended by Lundy. Preanesthetic stimulation is indicated only when the patient is too depressed by premedication. Stimulation during anesthesia is needed only for the treatment of respiratory depression by an overdose of the anesthetic agent. >

The postoperative temperatures in our cases

have not been higher than expected from any prolonged anesthetic and surgical procedures, contrary to the observation of Davison and Rudder. In 9 cases of fenestration for otosclerosis, in which we recorded the maximum postoperative rectal temperatures, there were the following peaks of temperature, which returned to normal in eight to twelve hours: 99.8, 100, 100.2, 100.2, 100.6, 100.6, 101, 101.8, 102.4 F.

We have observed no unusual tendency toward bleeding in operative areas, as might have been expected from the known vasodilator quality of pentothal. This favorable experience might have been due to the presence of large doses of atropine in our cases, so decreasing the parasympathetic action of pentothal.

Prolonged postoperative sleep is frequently noted after prolonged intravenous anesthesia. As with all methods of general anesthesia, the duration of this sleep is proportional to the duration of anesthesia. But true postoperative depression of respiration, circulation, and protective reflexes, sufficient to cause concern or require active therapy, has been as rare as with ether anesthesia. It has occurred only when we have carried the patient too deeply for too long or the surgical trauma was severe. Postoperative sleep for periods up to eight hours and drowsiness for the next twenty-four hours is more often encountered with the use of prolonged intravenous anesthesia. Such sleep or drowsiness is usually desirable and decreases the need for morphine postoperatively. It is a shallow narcosis which may be interrupted by loud commands and does not prevent the patient's cooperation in taking medication or fluids. It may decrease his attention to the need for urination and therefore require increased effort to prevent bladder overdistention. Sleep or depression following prolonged barbiturate anesthesia may be easily combated with repeated doses of coramine, metrazol or picrotoxin. When it is vital that the cough reflex and respiration be active immediately after operation, we have avoided the use of intravenous anesthesia for even short cases, unless an endotracheal airway is to remain until the patient is fully awake, and the patient is repeatedly roused by regular doses of an analeptic, frequent change of position, and verbal encouragement of deep respiration and cough.

The conditions which insure the clinical safety of intravenous pentothal sodium for long anesthesias are: (1) the supervision of the patient by a competent anesthetist; (2) the immediate accessibility and application of equipment for the administration of oxygen under pressure, establishing the patency of the entire

Palmer<sup>14</sup> (1939) stated that pentothal anesthesia can be maintained with comparative safety in trained hands for major surgery over long periods without any apparent deleterious effects. The longest case in his large group, most of which were major procedures, was three hours and twenty-five minutes, using 2.75 Gm. of pentothal.

Davison and Rudder<sup>15</sup> (1940) reported 1,524 consecutive major operations in which the only anesthetic was pentothal sodium; very many of the cases lasted one hour or more, and many patients received 2, 3, and 4 Gm. doses. All patients received careful observation and continuous inhalation of 100 per cent oxygen.

Moore<sup>16</sup> (1940), who considers the pentothal the agent of choice in casualty clearing stations, reported 200 operations, of which the longest was two hours, requiring 2.25 Gm. pentothal.

Joers<sup>17</sup> (1942) used pentothal in more than 100 major cases. In some cases, such as brain tumor operations, gastric resections, or bone surgery, the drug was administered for three or four hours without complications.

Ruth et al. 18 have used as much as 3.15 Gm. of pentothal during an anesthesia of five and one-quarter hours for a neurosurgical procedure.

Hand and Edwards<sup>19</sup> (1942) stated that "at the Lahey Clinic pentothal as the primary agent is still limited to minor procedures in which relaxation is not a prime factor. When used in long procedures as a supplementary or complementary agent, oxygen or a nitrous oxide-oxygen mixture with 30-50 per cent oxygen, is routinely added."

Adams and Gray<sup>20</sup> have reported the excellent value of pentothal sodium for repair of a gunshot laceration of diaphragm, lung, abdominal and chest walls, and spleen in a shocked 26-year-old woman who was successfully repaired during 105 minutes of anesthesia with 16 cc. of a 2.5 per cent solution. Of course this patient simultaneously received the benefit of shock therapy, intratracheal airway administration of 50 per nitrous oxide, oxygen-50 per cent tracheobronchial suction, and-most important of all-very gradual intermittent additions of 1 cc. units under the care of a highly expert anesthetist.

Randolph and Kober<sup>21</sup> (1943), in their use of pentothal for 123 thoracoplasties, ran an unstated number of their operations for one hour or more, the longest being 115 minutes. They also used more than 1 Gm. in most cases, the largest amount being 2.5 Gm. Half of their cases received oxygen by nasal catheter; an occasional case required oxygen by anesthetic apparatus, but seldom was a respiratory stimulant required.

Searles<sup>22</sup> (1942) has reported his large experi-

ence with over 2,000 personally administered intravenous anesthetics without a death. In many of his cases the period of anesthesia was up to four and five hours. But he rarely used more than 1 Gm. of pentothal, because he relegated it to the position of a supplementary or complementary agent to other drugs or regional blocks.

Davison<sup>23</sup> employed pentothal-sodium-oxygen anesthesia in 7,620 consecutive cases, regardless of the time required. One 12-year-old boy received 1.2 Gm. pentothal for a craniotomy and then, two weeks later, 1.5 Gm. for an eight-hour removal of a pineal tumor.

Wagner has employed pentothal sodium for some of his cases as long as two and one-half and three hours, using a maximal dose of 2.67 Gm. with favorable results.

Coryllos and Bass<sup>24</sup> have employed evipal in 605 thoracic procedures without an anesthetic death, although 11 patients required resuscitation for apnea. A large unstated number of the 605 operations probably lasted one hour or more.

This cursory review of the literature has impressed us with the growing tendency, also noted by Long and Ochsner,25 toward the use of intravenous barbiturates in doses larger than 1 Gm. and longer than one hour, in spite of the opinions expressed in most of the literature and by the Council on Pharmacy and Chemistry. This is particularly noticeable since the introduction of pentothal sodium, which is more suitable for prolonged anesthesia than evipal. Pentothal sodium is more potent, provides greater relaxation, allows quicker recovery, and rarely causes muscle twitching. Nevertheless the manufacturer of pentothal sodium has continued to urge, in the pamphlet packaged with the ampoule, that pentothal "is to be used only in cases of good anesthetic risks and for operative procedures in which anesthesia for from five to twenty minutes is required." Although the manufacturer correctly insists that "only expert anesthetists should employ pentothal sodium," yet, "pentothal sodium is not recommended in major operative procedures requiring prolonged anesthesia." We believe that the time has come to modify this conservative position still held by the majority of anesthetists and surgeons.

Only a minority of the authors quoted above applied all of the safeguards now known to be required to insure the safety of the patient. Yet few of them reported any complications during or following anesthesia. None had an anesthetic death in any procedure which lasted one hour or more. The great majority of all intravenous anesthetic deaths (in fact, all of the deaths we have read of) have occurred in the first half-hour of the anesthesia and were not apparently related to the duration of the anesthesia. They

straps about the extended forearm and wrist of the upper extremity in which the anesthetic is being injected; fixation of the other arm by wrist strap or body sheet; and, wherever possible, an assistant should hold the head fixed while maintaining an open airway (this is particularly important in surgery of the head and neck, especially when an intratracheal catheter is not in place).

- 4. Have the patient well atropinized (we prefer scopolamine for resistant cases), using  $^{1}/_{100}$  of a grain, and in some cases  $^{1}/_{75}$ , but take care to avoid giving it too early or too late for the display of its full effect at the onset of anesthesia. Give repeated doses of  $^{1}/_{400}$  of a grain to  $^{1}/_{100}$  of a grain of atropine sulfate intravenously during anesthesia, depending on the need for protection against respiratory tract spasm and mucus. The tolerance of anesthetized human beings to atropine is large.
- 5. Employ local or regional anesthesia as much as possible to decrease the need for greater depth of general anesthesia and larger doses of pentothal. Surface anesthesia is regularly added just before or after the induction of pentothal anesthesia.
- 6. Expertness in the art of venipuncture is necessary and the excellent suggestions of Lundy's should be used. Insert the intravenous needle, preferably an 18-19 gage, well in the vein and very securely, otherwise it will be a continuous source of delay.
- 7. Inject small doses, 1-3 cc., of 2.5 per cent solution intermittently, allowing full time for the circulation to distribute the drug and for the central nervous system to exhibit the full effect after each injection, usually one minute. It should be given more cautiously when the anesthesia exceeds two hours or when the patient is less than a fair risk. Maintenance of anesthesia becomes easier and requires less of the drug per unit of time as the duration increases beyond an hour.
- 8. The concentration of pentothal solution should be 2.5 per cent during the first two hours and I-1.5 per cent thereafter, if the patient has not shown a high degree of resistance to the pentothal in the second hour of anesthesia. The concentrations of 2.5 per cent or less require the anesthetist to administer pentothal very gradually; they do not affect the vein even in a long operation, or the perivenous tissues when infiltrated.
- 9. Give repeated doses of morphine sulphate intravenously when the patient continues to require 0.5 Gm. pentothal doses every fifteen minutes for two consecutive quarter hours. The size of each dose may vary from 1/40 of a grain to 1/5 of a grain, depending on the estimate of the patient's resistance to the anesthetic and

the absence of pinpoint pupils and serious respiratory depression.

- 10. Maintain an infusion of saline, glucose, plasma, or blood after the operation has exceeded one hour. Start it before anesthesia if the case is known to require more than one hour or if the patient is a suboptimal risk. We use the infusion to facilitate the maintenance of pentothal injections by inserting the needle of the pentothal syringe into the lumen of the infusion tubing, very close to the infusion needle in the vein. The needle connected to the pentothal syringe should be 20–22 gage. This fine needle and a strip of adhesive along the barrel of the syringe and over the handle of the piston will prevent back-flow into the syringe.
- 11. Avoid the use of an oral airway unless the mouth and pharynx have been numbed by spraying or swabbing with a local anesthetic, for "under light anesthesia a stimulus such as that caused by an artificial airway or a foreign substance in the pharynx or larynx may initiate a catastrophe" by spasm as well as require an unnecessarily deeper pentothal anesthesia. The type of airway least likely to start a spasm in an unanesthetized tract is a nasopharyngeal tube. It is best, wherever possible, to use an airway in a cocainized pharynx and mouth. Dental and oral props should be inserted before anesthesia for intraoral and transoral operations.
- 12. Use an intratracheal airway coated with a water-soluble anesthetic lubricant, in a numbed larynx in any case in which there is marked likelihood of some interference with the airway because of the nature of the disease or operation.
- 13. Maintain a level of anesthesia as low as is consistent with the needs of the surgeon, never exceeding second plane of third stage. With an airway present in a cocainized pharynx we have been able to maintain a level so shallow that swallowing would frequently recur during operation, yet the patient would remain quiet with relaxed jaw and extremities.
- 14. Use oxygen insufflation or inhalation (depending on whether or not a closed system is desirable) at the least suspicion of anoxemia, such as undue elevation of pulse rate. We use it routinely when the patient is in poor condition at the start, the anesthesia exceeds two hours, or respiration is too depressed.
- 15. Use various mixtures of nitrous oxide and oxygen, whenever feasible, to supplement the primary anesthesia with pentothal. Ordinarily 50 per cent of each gas is supplied, never less than 20 per cent oxygen. This gaseous adjuvant moderately decreases the dose of pentothal and provides a rebreathing bag as a better indicator of respiratory movements. When one is not able to use a B-L-B or nasal mask or an anesthetic

airway and stimulation; (3) the use of all aids which decrease the dose and rate of pentothal consumption, enable the surgery to be performed with a lighter plane of pentothal anesthesia, and reduce the incidence of respiratory depression and obstruction; and, (4) finally, the correct choice of the patient for intravenous anesthesia—namely, one whose oxygen transport system can be protected and supported during intravenous barbiturate anesthesia and whose surgical procedure does not require deep relaxation.

All of these principles have as their purpose the single object that no respiratory depression or obstruction or anoxia should ever be allowed to exist for more than a few seconds. Early detection and prompt correction of anoxia are the sine qua non of intravenous as well as any form of general anesthesia. Anoxia is insidious in origin and effect during intravenous anesthesia. Therefore it is fundamental to the proper application of intravenous anesthesia for long cases that a trained observer of respiratory activity apply the method with adequate equipment at hand in the proper type of patient without seeking maximum muscular relaxation. This is nothing more than the high standard of anesthetic care insisted upon by all authorities, even for short cases, but it is absolutely necessary for the safe use of intravenous anesthesia in prolonged surgery.

If we consider the competence of the anesthetist as the most important protection, the choice of the proper type of case is only slightly less vital to the good reputation of intravenous anesthesia. This point has been fully developed by many workers as well as by the author in another report.<sup>27</sup> However, the more expert the anesthetist and the greater the effort to maintain a normal oxygen transport mechanism, the wider will be the range of cases in which the great advantages of intravenous anesthesia, especially for military surgery, may be obtained.

The 37 cases in which we have used pentothal sodium as the primary agent for one hour or more could have been multiplied many times in civilian surgery were it not for the following tendencies in our practice of anesthesiology: (1) we prefer spinal anesthesia in all good or fair risk cases for surgery below the diaphragm, especially if maximum muscular relaxation is required, and (2) we avoid intravenous anesthesia when the surgeon has a marked preference for an equally good alternate method of general anesthesia.

Thus our cases have not been many; but they were well studied because they were problem cases (as explained in a previous paper)<sup>27</sup> which were best handled by the use of pentothal sodium intravenous anesthesia. Small as the group has

been, and though they were special types in difficulty or hazard, they have clearly pointed to the conclusion that prolonged pentothal intravenous anesthesia is and can be kept safe.

Our 37 anesthesias of one hour or more in-

cluded the following cases:

Eleven cases of fenestration for otosclerosis lasting four hours to six hours and fifteen minutes, and requiring 1.75 to 4 Gm. of pentothal sodium; a seventy-minute transurethral resection in a 101-year-old psychotic male; an eight-hour cerebellar exploration in a 10-year-old boy; a four-hour laryngectomy; a three-hour radical mastectomy; a two-hour removal of tumor of orbit; a two-hour and ten minute esophagectomy; a one-and-a-half-hour suspension laryngoscopy and fulguration: a one-and-a-half-hour exploration of petrous pyramid; a one-and-aquarter-hour plastic repair of orbit in a 70-yearold male; a sixty-minute enucleation of the eye in a 66-year-old psychotic female; and a sixtyminute radical mastoidectomy in a 21-year-old toxic male.

#### Technic

We consider the following points in technic as important:

1. Premedication is desirable but not absolutely necessary. It must be administered so as to secure its maximum effect before or during the early phase of anesthesia. We prefer 1-3 grains of pentobarbital sodium two hours preoperatively, 1/6-1/4 grains of morphine sulfate with 1/100 grains of scopolamine hydrobromide one to one and one-half hours preoperatively, for good risk adults. The smaller, the younger the patient is, or the worse his condition, so much proportionately is the dose of premedication reduced. If the premedication is desirable, as it usually is for long cases, but it has not been given before the patient reaches the operating room, we use the intravenous route for both morphine and scopolamine, and then allow about ten minutes for a marked effect to appear.

2. Have the patient clear his nose and throat well before induction. This tends to avoid such respiratory irregularities as sneezing, coughing, asthmatic breathing, laryngospasm and mucous

obstruction.

3. "Restraints" are desirable but not absolutely necessary. They reduce the dosage of pentothal sodium for prolonged surgery by allowing the anesthetist an extra margin of light anesthesia. The patient may then be allowed to tense or move slightly his extremities or head with the knowledge that the "restraints" will hold the patient for the minute needed to deepen anesthesia. The "restraints" should be a broad strap just above the knees; adhesive or bandage

TABLE OF CASES REPORTED BY LT. M. H. ADELMAN

wounds, and 15 widely excised extensive wounds. Premedication was 1/4-1/3 of a grain of morphine sulfate, injected intravenously; no untoward effects of this practice were encountered. tothal proved invaluable and . . . is the anesthetic of choice in 9 cases out of 10." There is no statement of the length of anesthesia in Major Cope's cases, but the detailed description of the operations leaves no doubt that a large number were one hour or more in duration in seriously ill patients. One of every three patients operated on required transfusion. There were six deaths, a mortality of 1.8 per cent. Only one of these was attributed to the anesthetic, in a severely wounded patient in poor condition. The absence of details in this report prevents us from determining whether the patient was surrounded by the precautions described above and now available in most units where major surgery is performed in the zones of operations, communications, and interior. It is worthwhile to quote certain remarks of Major Ascroft. "Anesthetists should have at least one year's special training. It is a dangerous fallacy to suppose that a rag and bottle in the hands of any medical officer temporarily unemployed is good enough. The anesthetist must be a sound doctor and capable of running two cases at a time . . . . Forward surgery in busy times is a kind of mass production."

Pentothal sodium anesthesia for long cases is therefore applicable to a large percentage of military surgery. In fact, we cannot see how one can avoid using it. Many reports attest to the special adaptability of intravenous anesthesia to war surgery. The equipment for administration is simple and small; it is easy to sterilize, transport, and assemble. Because induction is quick, intravenous anesthesia is advantageous for casualties arriving in large numbers or for the many who are likely to be resistant to general anesthesia because of severe pain, excitement, hysteria, or lack of cooperation. Traumatic, thermal, blast, and gas injuries of the head, neck, and respiratory passages are best anesthetized with intravenous anesthesia when a general anesthesia is necessary. It also provides a noninflammable system which permits the safe use of cautery, diathermy, and x-ray apparatus, and removes an additional explosion and fire hazard in case of enemy attack. If these and many other advantages of intravenous anesthesia are to be exploited only for short cases. a severe limitation is imposed on its usefulness in military surgery. A large number of procedures require surgery for a duration which cannot be predetermined, because wounds and foreign bodies may prove to be more difficult to treat than anticipated. It is, therefore, especially important that general acceptance be given now to the removal of the time and dosage limits on intravenous pentothal sodium anesthesia.

The safety of intravenous pentothal anesthesia in the presence of shock and high sulfonamide blood levels must be considered. The Mayo Clinic group of anesthesiologists and research workers34 believe that barbiturates tend to delay the onset of shock and diminish its severity. Lundy, Adams, and Searles have successfully given intravenous pentothal for patients in shock, who simultaneously received specific therapy for shock. Their experiences have been duplicated by Lt. Adelman, Major Cope, and many others. These results were achieved by the simultaneous use of specific shock therapy, oxygen, and minute doses of pentothal sodium, as little as 2 cc. of 2.5 per cent solution for an amputation of an arm. "It is amazing how little of the drug will provide relaxation for such patients." No definitive study of a large number of shocked patients has been published to decide the relative safety of pentothal in such cases. On the evidence available at present we believe there is justification for its use, in the absence of cyclopropane, for a shocked casualty requiring general anesthesia, provided he receives minimal doses of pentothal, inhalation of oxygen, and a simultaneous infusion of plasma or blood.

rebreathing bag, the best guide to the depth of respiration is the visible or palpable movement of the upper abdominal wall.

16. The depth, rate, and character of respiration is the most reliable index of depth of anesthesia, after the patient fails to respond to painful skin stimulation. The cutaneous zone and the respiratory tract are the most sensitive areas for the production of reflex movements. Local or block anesthesia for these areas greatly decreases the dose of pentothal.

17. Reduce the depth of anesthesia in the closing stage of the operation so as to have the patient reacting to skin stimuli at the end.

18. Three to five cubic centimeters of coramine, or 1-2 cc. of metrazol, 30 intramuscularly or intravenously, depending on the final depth of anesthesia, should be injected at the close of the operation and repeated every half hour, when it is desirable to obtain the earliest awakening. We use it routinely at the end if the dose of pentothal has exceeded 2 Gm. or the general condition of the patient was suboptimal prior to or at any time during anesthesia.

19. Blood pressure determinations are not routinely taken because we have found them not to be significantly elevated or depressed by the anesthesia. When the surgery is quite traumatic, the blood loss significant, or the patient's preoperative condition poor, we do record blood pressure at frequent intervals.

#### Application to Military Surgery

Lundy has predicted that intravenous barbiturates will be used more often than any other type of anesthetic. Wiggin<sup>31</sup> has stated that it is already the most common general type of anesthetic in service for cases not requiring deep relaxation. Many reports from abroad, especially England, have provided the basis for these statements.

Prolonged intravenous pentothal anesthesia is becoming applicable at any point in the line of the evacuation of the wounded from the casualty clearing station back to the general hospital because favorable conditions are growing more widely disseminated with the greatly enlarged number of trained medical anesthetists in the armed forces and the increasing availability of oxygen apparatus.

In considering the type of cases in which intravenous anesthesia for prolonged surgery would be indicated, we must remember that the exigencies of the military situation may require that contraindications respected under normal conditions be brushed aside. Then one must exert extra effort to prevent complications and one should provide compensatory therapeutic measures to bolster the patient. Most categories

of war injuries are quite suitable for prolonged intravenous pentothal because they require little or only moderate depth of anesthesia. Examples are débridement of burns and wounds, removal of foreign bodies, reduction of fractures, peripheral nerve repair, amputations. For such casualties as penetrating thoracic and abdominal wounds, intracranial injuries, shocked cases requiring urgent surgery, and traumatic and inflammatory encroachment on the respiratory tract, we would not prefer intravenous anesthesia if anesthetic gases or regional blocks could be employed. Yet even these cases have been safely anesthetized for long major procedures by expert anesthetists who guarded the patient with appropriate airways, transfusion, oxygen, and minor complementary anesthetics while employing minimal doses and levels of pentothal anesthesia.

For the dark side of the picture we have found no better expression of the danger of indiscriminately using intravenous pentothal, even for only short cases, than the report of a civilian surgeon, Halford.32 He has severely condemned it on the basis of his observations at Pearl Harbor, where several deaths occurred. Without anesthetists and adequate means of supplying oxygen and plasma, we should expect seriously wounded patients, insufficiently treated for shock, to be asphyxiated by intravenous anesthesia. It should not have been used under these conditions, for they were the very same conditions, of inadequate anesthetic care and poor risk patient, which were responsible for most of the deaths early in the development of evipal anesthesia.

The author's own experience in military service has been so limited that he has had only a few opportunities to apply intravenous pentothal for surgical procedures of an hour or more. The cases and the conditions of our military anesthetic practice have been very much like those met in civilian surgery where spinal and regional block anesthesias are the methods of choice. However, we were requested to show the applicability of prolonged intravenous anesthesia to war surgery. We can do it by describing the experiences of two expert anesthetists who have had the opportunities which we expect to duplicate. With the permission of Lt. Milton H. Adelman, who was influenced by the author to apply this method, we are able to report the following 21 unpublished instances of prolonged pentothal anesthesia.

The other anesthetist is Maj. R. W. Cope, with a British mobile surgical unit, whose experiences in the Western Desert were reported briefly by Maj. P. B. Ascroft.<sup>33</sup> There were 93 minor and 239 major operations, including 27 eranial procedures, 14 penetration thoracic or abdominal

prepared for general distribution to all medical officers, describing in detail its technic and limitations.

In civilian practice we have been using it in: (1) brain surgery; (2) as an adjunct to continuous spinal anesthesia, for patients, unsuitable to be awake, and for control of nausea; (3) eye surgery; (4) débridement of burns and in skin grafts; (5) cesarean section; (6) urological and dental cases; (7) and in cases where a nonexplosive anesthetic is the one of choice, where nitrous oxide is insufficient for the contemplated procedure.

There are many technical aids available. We often use a direct transfusion outfit or a two-way stopcock to which intravenous fluids may be attached. In cases where a face mask is unsuitable, we use a nasopharyngeal tube for the administration of continuous oxygen. A length of small rubber tubing may connect needle and syringe, thereby allowing the anesthetist to use both hands. Some devices also clamp the syringe to the table.

I feel that these indications and technical aids so widely used in civilian practice can easily be adapted to military use.

With regard to use of intravenous pentothal sodium in cases of shock, my opinions are in accord with those of Dr. Beecher—that we do not have sufficient similar cases in civilian practice to compare with seriously wounded patients encountered in warfare, because operation is usually delayed until the patient's condition has improved as much as it will without surgery. Dr. Beecher thinks that the barbiturates do not delay shock which has been produced by bleeding or hemorrhage, but appear to delay it only when the chief shock-producing trauma is dehydration or plasma loss from wound surfaces. Lundy, Adams, and Searles state that when pentothal is administered early, before shock has become severe, it may aid in delaying its onset.

Recently Drs. Gray and Adams reported its successful use in the case of a seriously wounded civilian patient, which was comparable to military surgery.

The use of pentothal in combat areas entails the employment of certain precautions, the first of which is the realization of marked individual variation in dosage. We must also remember that most authorities still feel that it should be used only in cases in which no great muscular relaxation is required. Consideration of previous dosage of morphine is also of prime importance.

In severe shock or in seriously wounded patients only minute, intermittent, and small total dosages of weak solutions should be used, and an ample supply of oxygen, to be administered simultaneously, must be available.

The success of prolonged intravenous pentothal anesthesia in military surgery will depend for the most part upon the skill of the person administering it and his full knowledge and appreciation of its limitations.

#### STUDY VETERANS' EMPLOYMENT PROBLEMS

Specific instructions in handling veterans' employment problems are being given all employees of the United States Employment Service, Paul V. McNutt, chairman of the War Manpower Commission, has announced.

Mr. McNutt said that this was in line with an agreement just concluded between the War Manpower Commission and the Selective Service whereby WMC assumes the entire responsibility for placing the returning veterans in new jobs. Under the agreement, he said, the Selective Service will make the veteran's re-employment in his old job its special responsibility but WMC is to take over if the veteran is not interested in going back to his

lormer employer.

The War Manpower Commission and the Selective Service are in complete unity on the problem of returning the discharged veteran to civilian life," said Mr. McNutt. Training programs are being installed in all of the United States Employment Service's 1,500 offices. Each member of the local office staff is being given an extensive course of instruction in veterans' problems. Mr. McNutt said that each office will have, as in the past, its special Veterans' Employment division representative and, if the load is sufficiently heavy, other experts with specialized experience in handling veterans' employment problems. The entire staff, however, will be

made aware of the various avenues to employment open to the veteran—such as, for example, training and rehabilitation.

"This means," said Mr. McNutt, "that the entire 22,000 employees of the USES will participate in the program."

Biregional conferences are now being held throughout the country in connection with this training program. Attending this conference are state WMC officials, State Veterans' Employment representatives, and representatives of the WMC

regional offices.

Tests of new technics and methods of handling veterans' problems are now being made in seven USES offices, picked as demonstration centers for the variety of problems they represent. These offices are at Los Angeles, Houston, St. Louis, Minneapolis, Philadelphia, New Haven, and Denver.

The tests were completed April 1 and the program developed will be ready, with modifications to meet local needs, for installation in all of the 1,500 USES offices. The training now under way in the USES field is shaped to fit into this larger program. The Federal Civil Service Commission will continue to exercise jurisdiction over the placement of veterans in the Federal executive civil service.—Release from the Office of War Information

As to whether there is any increased depressive effect of pentothal sodium on patients under sulfonamide therapy, we are not aware of any human case in which this supposed synergism has been proved. The consensus of clinical experience in British circles 35,36 is that sulfonamides are no contraindication to intravenous pentothal. However, if the patient is cyanotic from a sulfonamide and is about to receive an intravenous, or any general anesthetic, the anesthetist is faced with a real problem. For he is deprived of the important sign of skin color which is a valuable clinical guide to the degree of anoxemia present. The anesthetist may use 100 per cent oxygen inhalation prophylactically. 37 but this is a poor solution of the difficulty, because it does not remove the cyanosis of sulfonamide origin. A patient may breathe 100 per cent oxygen and yet suffer anoxemia because of respiratory or circulatory depression. A better method38 is to remove the cyanosis before operation by the use of methylene blue, which converts methemoglobin to hemoglobin. If twentyfour hours are available preoperatively, one may use 6-12 grains of methylene blue, given orally in six divided doses. With the intravenous route Hewer<sup>38</sup> has removed the cyanosis within ninety minutes by injecting 0.5 mg./Kg. of methylene blue in solution. It is entirely innocuous and is especially suitable for emergency military anesthesia on casualties heavily dosed with sulfonamides.

#### Conclusions

Intravenous pentothal sodium anesthesia for one hour or more is safe for operations requiring little or moderate relaxation, provided the proper safeguards are available. The sine qua non for the continuation of the excellent record of prolonged pentothal anesthesia in civilian and military surgery is close observation of the patient, the detailed knowledge and meticulous technic provided by an expert anesthetist. Like cyclopropane, prolonged pentothal anesthesia is decidedly not for the novice or technician.

#### Summary

We have traced the increasing use of intravenous barbiturates, especially pentothal sodium, for anesthesia of one hour or more. Its record of mortality has been practically nil. We have been able to report the application of prolonged pentothal, under safeguards which have been fully described, to 5S cases suitable for intravenous anesthesia of one hour or more. Pentothal anesthesia was given one patient for eight hours, another for more than six hours, six patients for five hours or longer, five patients for

four hours or longer, three patients for three hours, eight patients for two hours or more, thirty-four patients for one hour or more. No death or serious complication was encoun-

The applicability of prolonged pentothal anesthesia for a large part of military surgery has been stressed by the presentation of cases and reports from the literature.\*

\*Added experience with military casualties in a general hospital has confirmed the experiences and conclusions stated in the article.

#### Discussion

Dr. Rose M. Lenahan, Buffalo-It is a pleasure to express admiration for Captain Greene's comprehensive paper.

In a review of the literature for 1942, Lundy, who was the pioneer in intravenous pentothal anesthesia,

feels that it continues to be the best agent. Lt. Col. Types has stated that the Surgeon General places so much importance on intravenous anesthesia for wartime use that a manual is being

TABLE 1.—General Data Regarding Patients Treated at the Inhalation Department of Sabatoga Spa, 1938-1939

the number of treatments taken is shown in Table 2.

The majority of the patients took from one to five treatments although a sufficient number took more than five treatments, permitting further analysis of the relation between the number of treatments and the results obtained.

The 738 patients who took regular treatments have been classified in four groups on the basis of relief obtained. For this purpose the following criteria of the results of treatment were used:

Group 1. No change—no influence noted in symptoms following treatments.

Group 2. Temporary—slight or temporary relief of symptoms noted for a short time following treatment.

Group 3. Moderate—partial to complete relief obtained during course of treatment.

Group 4. Marked—complete relief of symptoms which persisted for an indefinite time after the course of treatment.

Opportunity was not available to study the patients following treatment with roentgenograms or other objective measures. However, the number of patients who returned for treatment during the second year was sufficient to establish the fact that in some patients the relief obtained was permanent.

To determine the length of an optimum course of treatment, the average number of treatments taken by the patients in each group, as classified for the relief obtained, was calculated. The data regarding the results of treatment and the average number of treatments taken by the patients in each group are presented in Table 3.

The striking relation between the number of treatments taken and the results obtained is shown graphically in Chart 1. This is best noted in curves 1, 3, 4, 5, and 7, which represent chronic or prolonged disorders of the respiratory tract, while in curves 2, 6, 8, and 9, which represent acute conditions, better results with a relatively smaller number of treatments are evident.

The patients were all ambulatory and came to the inhalatorium for their treatment, for the

most part daily, or in some cases three times a week.

#### Nature of Waters and Medications

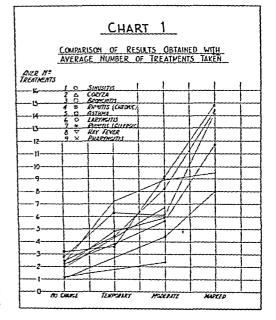

#### A. Mineral Waters

1. Saratoga Geyser Water contains 2.5 Gm. of sodium chloride and 5.0 Gm. of sodium, calcium and magnesium bicarbonates per liter and is supersaturated with carbon dioxide. The total mineral concentration is only slightly below that of physiologic saline.

2. Saratoga Hathorn Water contains 8.6 Gm. of sodium chloride and 6.1 Gm. of the combined bicarbonates and is super-saturated with carbon dioxide.

#### B. Medications

1. Glycirenan (Silten) contains 0.1 per cent epinephrine, 0.7 per cent chlorbutol, and 30 per cent glycerin.

# INHALATION THERAPY USING MINERAL WATERS AND MEDICATED OILS

WALTER S. McClellan, M.D., Saratoga Springs, New York, with the technical assistance of Margaret Rogers, R.N.

MANY forms of therapy, including vapors, irrigations, drops, topical applications, "benzedrine inhalers," and surgical measures, are used in the treatment of respiratory ailments. Various chemical and biologic preparations are applied for their antiseptic, astringent, and vaso-constricting effects.

Inhalations of epinephrine preparations, with the respiratory tract as the portal of entry, are used in the treatment of patients with bronchial asthma, and pituitrin is used for diabetes insipidus.

An evaluation of the results with inhalations of mineral water supplemented by medicated oils is presented herein. The finely nebulized water, including its mineral constituents and gaseous components, is introduced into the respiratory tract. The objects of the treatment are to remove deposits, improve ciliary action, increase circulation, reduce congestion, and promote drainage.

#### Literature on Inhalation Therapy

Similar treatments have been developed extensively at Bad Ems, Bad Reichenhall, Mont-Dore, and other spas abroad. Diener, of Bad Ems, reports generally good results from inhalations of the mineral water combined with its use internally in patients with chronic catarrhs of the upper air passages and also in chronic bronchitis. Also, when this treatment is combined with pneumatic chamber treatment, the patients with emphysema and asthma obtain relief.

Diener<sup>2</sup> reports that 60 per cent of a series of patients with asthma were relieved completely or were very much improved following the program at Bad Ems. In a small group of patients who were treated in addition with a foreign protein and roentgen rays, 10 out of 12 received definite relief.

Graeser<sup>3</sup> found consistently good results in treating patients with bronchial asthma with the inhalation of epinephrine 1:100. The results with weaker solutions were less consistent. He noted that "Several patients reported good relief on some occasions from salt solution alone." This observation may be of some significance in showing a possible influence of saline solutions on the sensitivity of the mucous membranes in

some patients. He noted that a few patients complained of dryness in the throat and increase of cough. Only rarely did he observe general reactions to the medication. These included headache, palpitation, and tachycardia.

Galgiani and his coworkers<sup>4</sup> studied the inhalation of epinephrine in animals and concluded that the effective dose was considerably less when inhaled than when given by other channels. They concluded that the effect was produced by local action on the mucous membrane because they found little influence on the pulse and blood pressure in the animals studied. These authors, and also Fox,<sup>5</sup> found some evidence of denuded mucous membranes, particularly with epinephrine 1:100, which they considered was caused by local vasoconstriction and tissue anoxemia.

Weiss<sup>6</sup> has recently discussed the general phases of inhalation treatments with saline waters and other medications.

Holinger, Basch, and Poncher observed the viscosity, the pH, and the chemical content of sputum obtained by bronchoscope from the major and the terminalb ronchi following the administration of expectorant drugsand steam and gas inhalations. They report that inhalations of steam, highly humidified air, and carbon dioxide all act to liquify the tenacious secretions of the bronchial tree, while in contrast the inhalation of oxygen acts as an antiexpectorant.

#### Material Studied

The inhalation department at Saratoga Spa has been in operation for the past eight years. This report is based on the study of 1,055 patients treated during 1938 and 1939. They represent a variety of respiratory disorders. Table 1 includes a summary of the number of patients, their sex, and the conditions for which they were treated.

Of the 1,055 patients treated, 549 were men and 506 were women. The large majority were adults, except for 12 children who were treated principally for bronchial asthma.

In all conditions except coryza, when the patient took only one treatment, it was classified as a trial treatment and excluded from the later detailed analysis of the results of treatment. Patients with acute coryza often experienced relief after one treatment. Three hundred and seventeen patients took only a trial treatment.

The distribution of the patients on the basis of

From the Medical Department of The Saratoga Spa, Saratoga Springs, New York:

<sup>\*</sup> The figures in parentheses represent only one patient so their cannot be taken as averages

previous course of treatment, and they reported that they had less frequent and less severe recurrences during the winter following their course of treatment.

Case 1—A woman, 65 years old, reported a chronic sinus inflammation and sore throat for years with recurrent attacks, particularly in the frontal sinuses, causing severe headaches

From September 30, 1938, to October 14, 1938, she took thirteen inhalations using the general program outlined above. She experienced relief of persistent discomfort, and increased ability to breathe through her nose.

On May 1, 1939, the patient reported that while she had some discomfort through the winter, with one acute exacerbation, she had much less disturbance and pain was less severe than during the recent years before she had taken the inhalations, when she frequently had three or four acute attacks From May 1, 1939, to May 20, 1939, she took eighteen treatments and felt well. On October 31, 1939, she reported that the relief obtained after the last series of inhalations has continued during the interim. Between October 31, 1939, and November 16, 1939, she had eight treatments.

This patient was classified as obtaining moderate relief

Case 2—A woman, 46 years old, stated that she has required frequent packs and suction treatment for her sinus condition for four years

From August 9, 1938, to August 27, 1938, she received seven treatments and experienced complete rehef of her headaches and marked improvement of nasal congestion. On August 10, 1939, this patient reported that she had not visited her physician during the winter and had experienced only two mild attacks. From August 10, 1939, to August 28, 1939, she had eight treatments and reported that she was free from symptoms.

This patient was classified as obtaining marked relief

2 Coryza.—In this group 197 patients with acute "cold in the head" characterized by sneezing, musual congestion, watery discharge from nose, and lacrimation, were treated. The usual program included from one to three or four treat-

ments which routinely consisted of ten to fifteen minutes in the cabinet, followed by jodirenan by nasal tips for five minutes at low pressure to prevent any possible spread, and chlorenan for five minutes.

It was found that 49 patients experienced real relief with one treatment and 47 with two treatments, while only 5 patients of those who did not obtain relief took more than one treatment. It appears that two to three treatments are necessary to obtain the best results

The natural course of a "cold in the head" varies with different people Even without treatment a considerable number have symptoms for only one, two, or three days, while many others will have congestion for from four to seven days. In observing the patients treated, nearly all had some temporary rehef for a few hours after the first treatment and were relieved after the second or third inhalation pression prevails that the infection spreads less frequently to the throat and chest in the treated patients than in a comparable group not so Because of the natural variability in treated this condition, all patients who obtained relief were classified as moderately relieved.

Case 3.—A woman, 60 years old, stated that she has had a "cold" for two days with difficulty in breathing through the nose and some burning of the eyes. There has been no sore throat. She took four treatments and reported definite relief after the second treatment. At the end of the course she was free from congestion.

Case 4—A man, aged 45, complained that he had had watery discharge from the nose and definite difficulty in breathing through the nose for the preceding twenty-four hours. He also had lacrimation. He had no throat or chest symptoms. After two treatments he noticed definite relief.

3 Bronchitis —Included in this group were 100 patients who for the most part suffered from chronic cough with some expectoration and usually with some difficulty in breathing Twenty-six patients were suffering from an

- 2. Glycircnan-Forte (Silten) same as glycircnan, except that it contains 0.2 per cent epinephrine.
- 3. Jodirenan (Silten) contains 0.1 per cent iodine, 0.1 per cent epinephrine, 0.1 per cent sodium iodide, and 30 per cent glycerin.
- 4. Chlorenan (Silten) contains 1 per cent chlorbutol, 1 per cent menthol, and 2.5 per cent camphor in a special solution for inhalation.
- 5. Inhaledrin-Compositum (Silten) contains 5 per cent ephedrine hydrochloride, 0.06 per cent epinephrine, 2.7 per cent chlorbutol, and 30 per cent glycerin.
- 6. Adrephine Inhalant (Parke-Davis Co.) contains 0.01 per cent adrenalin, 1 per cent ephedrine hydrochloride, 1 per cent benzocaine, 0.5 per cent chloretone, 12 per cent alcohol, and glycerin.
  - Oil of Pine Needles—4 parts.
     Oil of Eucalyptus—1 part.

#### Methods of Application

The waters and medications were administered either by direct or indirect inhalation.

In the direct (table) inhalation, the Geyser water was used in the Atmos brine dispenser (Silten Co.), where it was warmed to approximately 80 F, and nebulized into a fine mist by compressed air. Suitable attachments permitted the inhalation of this mist through the nose, thus affording direct contact with the mucous membranes of the nasal and adjoining air spaces, or through the mouth, where the mist reached more directly into the lower air passages.

The medicated oils were nebulized into fine particles in the Spiess tube with a small glass vial permitting the use of 0.5 to 1 cc. of the medication for each treatment. Attachments allowing direct inhalation included two glass tips inserted into the nose for application to the upper respiratory tract and a mask for general administration.

For indirect (cabinet) inhalation the Hathorn water was nebulized in a larger dispenser so that the mist filled the cabinet. The air of the cabinet was slightly warmed. Oil of pine needles and oil of eucalyptus in combination were added to the air of the cabinet, using a Spiess tube unit. The patient sat in the cabinet and normally inhaled the atmosphere containing the finely nebulized mineral water mist.

#### Conditions Treated

1. Sinusitis.—The largest single group of patients, 242, or one-third of all patients, had a history of chronic sinus inflammation usually lasting over a period of years. Forty-six patients in this group took the treatment for an acute or subacute exacerbation of their condition. They were suffering pain over the involved sinus and blocking of nasal passages. In general they were afebrile.

The program of treatment included the administration of glycirenan by nasal tips for five minutes, followed by table inhalation with nasal outlet for ten minutes, and ending with chlorenan by nasal tips for five minutes. Other combinations of water and medications were tried but none gave the consistent relief found with the above combination. In some patients, adrephine inhalant was substituted for the chlorenan with fair results.

The patient with acute symptoms usually experienced some relief with the first treatment and definite relief of pain associated with profuse drainage after the third or fourth treatment. From seven to ten treatments were required to give more lasting relief.

In the patient with only the chronic condition, some relief was obtained after four to five treatments and the best results by taking from six to eight treatments on successive days, followed by approximately the same number on alternate days

In the series of patients treated, the larger number, 160, experienced moderate relief even though they took on the average only 5.7 treatments. The 14 patients who obtained marked relief took an average of 11.7 treatments. It is evident that the patient with sinus inflammation should take a series of from twelve to fifteen treatments in order to obtain definite relief.

In this group 24, or 10 per cent, had taken a

5. Bronchial Asthma.—In a small series of 38 patients who had a history of asthma the results were encouraging.

The program generally used was the cabinet for ten to twenty minutes, followed by chlorenan by nasal tips for five minutes, and glycirenan by mask for five minutes. It was necessary in some patients to omit the cabinet and use the table inhalation. In a few patients jodirenan was used in place of glycirenan because of an associated infection.

To obtain the best results it was necessary to take from ten to twenty treatments. Those who obtained moderate relief averaged 9.1 treatments and those with marked relief averaged 14.8 treatments. The daily use of the treatment prolonged the interval between severe attacks.

Five patients were temporarily relieved from acute attacks only; 22 experienced more relief with less severe and less frequent attacks; and 5 patients obtained prolonged relief. These differences in response will be indicated in the individual histories.

Five patients returned for subsequent courses of treatment and reported that the interval was characterized by continued improvement as compared with the period before the inhalations.

Case 9.—A woman of 23 had had asthma for five years. For five months she had not been able to sleep without an ephedrine capsule to control paroxysms. The patient was thin and highly nervous.

From June 20, 1938, to July 18, 1938, she took seventeen treatments. During the first two or three treatments she expectorated a considerable amount of thick, yellow mucus and continued to expectorate later. During the fourth treatment she had a severe paroxysm following the use of the cabinet, which was relieved by inhalation of 0.5 cc. of epinephrine chloride 1:1,000. After six treatments, less difficulty in resting was noted, and after the eighth treatment she rested at night without ephedrine for the first time in five months. The improvement continued with less frequent and less severe attacks. Undue excitement would still precipitate mild attacks.

On September 15, 1938, the patient reported that she had had no asthmatic attacks since the end of her course of treatment. On November 21, 1938, she reported entire freedom from attacks and a gain in weight of 11 pounds. July 21, 1939, she reported that there had been no return of her asthma.

This patient obtained relief from the treatments with drainage of nasal infection, improved rest, and gain in weight. Her case illustrates the importance of general as well as local treatment. She was classified as obtaining marked relief.

Case 10.—A school girl, aged 13, had asthma for seven years. Skin tests showed sensitivity to dust and ragweed. The attacks may be precipitated by these agents and also by colds, strenuous exercise, fatigue, and excitement.

From September 27, 1938, to November 12, 1938, she took twenty-seven treatments of the regular type. She reported less frequent attacks during this period, one precipitated by playing soccer and one from fatigue and excitement. On January 4, 1939, she reported that there had been little trouble for the past two months and that she had just contracted a cold. She took 5 more treatments.

During the next year she continued her school work with only an occasional attack, which was precipitated usually by excessive fatigue.

The response to treatment by this patient was classed as moderate and, as is common, continued attention to the general factors, including rest, is important.

Case 11.—A 30-year-old housewife, seven months pregnant, gave a history of an attack of angioneurotic edema eight years previously, and skin tests one year before had shown that she was sensitive to fats, fish oil, and some starches. She had had autoinjections of her blood followed by relief. Her present attack started March 27, 1939, and she was hospitalized for rest and care. While she obtained relief following injections of epinephrine, the side-effects of headache and tachycardia were distressing.

From April 4, 1939, to May 2, 1939, she received twenty-one regular treatments and during that time was able to rest well, except for one night when she received an injection of epinephrine.

The treatments gave almost complete relief without any of the side-effects that occurred after injections of epinephrine. On May 3, 1939, her full term, a normal child was born. One month later the patient reported that she had been free from attacks since the birth of her child. She was classified as having obtained marked relief.

6. Laryngitis.—The patients in this group were characterized by acute irritation in the throat, associated with huskiness of voice. A few patients suffered from chronic or repeated difficulty of a similar type.

In the acute condition, treatment included the cabinet for from ten to twenty minutes, followed by chlorenan by mask for ten minutes. For the chronic condition, the table inhalation with mouthpiece was substituted for the cabinet.

The average number of treatments taken by the patients who obtained moderate relief was 4.4, while 3 patients with marked benefit took 8 treatments. Benefit was noted when cough was relieved, voice improved, and irritation decreased. In the acute type four or five treatments usually resulted in relief, while in chronic disturbances from 8 to 12 treatments were necessary.

Case 12.—A woman, 58 years old, reported irritation in throat and huskiness of voice periodically for five years. She had been much worse for the past week with marked huskiness.

She had fifteen treatments between October 5, 1939, and October 21, 1939. After the fourth treatment improvement in her voice was observed and she was able to rest comfortably at night. At the

exacerbation of the condition, giving acute symptoms. This condition is not infrequently associated with disorders of the heart and circulation which are commonly treated at the Spa.

The treatment here was principally by mask in order to get more complete penetration throughout the bronchial tree, using the table inhalation by mouth for ten minutes followed by chlorenan by mask for ten minutes.

A few patients with more acute symptoms were treated in the cabinet and when cough with expectoration was prominent, jodirenan by mask was given for five minutes after the Geyser water.

The patients who received moderate benefit took on the average 6.1 treatments. The figure of 6.3 treatments for patients with temporary relief is unduly high because of one patient who took a long series with only slight improvement. This patient's condition was complicated by emphysema.

The 30 patients who showed no change took on the average 2.7 treatments, while the 5 who obtained the greatest relief had an average of 14.2 treatments. It appears that the patient with chronic bronchitis should take from twelve to fifteen treatments on successive days, while the patients with acute symptoms require six to eight treatments for good results.

In analyzing the results of treatment, 58 per cent obtained moderate relief as evidenced by disappearance of the cough or definite reduction in its severity, thinning of the material expectorated, reduction in tightness through the chest, and increased comfort in breathing. Marked relief was difficult to obtain but complete relief of these symptoms was noted in 5 patients who took the longer courses of treatment.

In the group were 6 patients who had taken a course of treatment before and who reported that during the intervening winter they had had less difficulty with cough and breathing than they had had for several previous winters.

Case 5.—A woman 65 years old had had an irritating cough at intervals since a severe attack of bronchitis two years before. She took six treatments and experienced relief from her cough which, while still present, was much less frequent and severe.

This patient was classified as having moderate relief.

Case 6.—A man of 54 had complained of dry, irritating cough and a feeling of heaviness in the chest for some years. He had fourteen treatments. After the first week he expectorated a thin colorless mucous material and had less tightness in the chest.

At the end of the course he reported that he coughed only occasionally, and that his chest was free, and that his breathing was not difficult.

This patient was classified as obtaining marked relief.

4. Chronic Rhinitis.—In this group were 79 patients whose main complaints included a fullness in the back of the nose, posterior nasal accumulation of a tenacious, sticky secretion which would drop into the throat at night and cause cough in the morning, dryness of the nose and throat, and, in a few patients, a disturbance of hearing. The symptoms were chronic in nature and had persisted usually for years.

This group of patients responded best to the table inhalation with nose outlet for ten minutes, followed by chlorenan by nasal tips for ten minutes. The number of treatments taken averaged 8.3 for those who obtained moderate relief and 14.4 for the small group who benefited markedly.

As to results noted, 42 patients experienced moderate relief as indicated by a thinning of the tenacious mucus which could be more easily removed, a diminution of the secretion, and less difficulty in breathing.

Case 7.—A physician, 35 years old, for years had had chronic inflammation of the nasal passages with some acute attacks and with periodic disturbances of hearing which required instrumental treatment.

From September 27, 1938, to November 18, 1938, he received a course of twenty-three treatments of the type outlined above. He took the treatments daily for two weeks and then three times a week. His breathing was easier, and local treatment of the eustachian tube was much less painful. The secretion was less tenacious.

On June 16, 1939, he contracted a "head cold," but did not suffer from any ear complication as had commonly occurred in the past.

The result obtained in this patient was classed as moderate relief.

Case 8.—A tree surgeon, aged 40, suffered from thick sticky mucus accumulating in the throat in the morning. At times it produced nausea through gagging and caused considerable difficulty until nose and throat were cleared. He also noticed some disturbance of sleep from difficulty in breathing through his nose.

From September 30, 1938, to November 26, 1938, he received twenty-four regular treatments, the first nine on consecutive days and the rest three times a week. After five treatments the patient reported better rest and less mucus in the morning. At the end of the course he was practically free from symptoms.

He reported on February 14, 1939, that he had had no disturbance during the interval even when he was working in a dusty atmosphere. On May 24, 1939, he reported some headache and secretion while spraying trees. On July 5, 1939, he returned and took four treatments, which resulted in complete relief.

This patient was classified as obtaining marked relief.

tients includes those with "acute sore throat" characterized by redness, difficulty in swallowing, and sometimes by excessive dryness. It is frequently associated with either acute coryza or acute laryngitis and is present in a moderate degree in many patients whose ailments are classified under those headings. Also there were a few patients who had chronic dryness and irritation in the throat and whose symptoms closely simulate chronic rhinitis.

For these patients, if the condition was acute, the cabinet was used, followed by chlorenan by mask. If the condition was chronic, then table inhalation with mouthpiece was given instead of the cabinet.

Nearly all patients experienced moderate relief and took an average of 6.7 treatments. In the acute group from four to six treatments were sufficient and in the chronic group from ten to lifteen treatments were required to produce good results.

Case 18.—A 45-year-old woman had had recurrent attacks of acute sore throat, sometimes with coryza or laryngitis and disturbance of hearing.

From November 4, 1938, to November 17, 1939, she had four distinct attacks, in November, February, May, and November, and took from three to twelve treatments each time. In all attacks, moderation in the severity of symptoms was noted, and in only one attack were more than five treatments required.

This patient had recurrent acute attacks for which treatment gave relief. She was classified as obtaining moderate relief.

#### Evaluation of Results

Acute nasal or respiratory conditions which are represented by acute coryza, laryngitis, pharyngitis, and hay fever are all characterized by relatively short duration and any treatment to be considered of value must relieve the severity or shorten the duration of the symptoms and prevent complications. Inhalations with the various combinations of mineral waters and medications have been evaluated on the basis of these criteria. The severity of symptoms is modified for many of these patients so that they have less discomfort during their acute attacks. The duration of these acute conditions is variable, usually lasting from one to seven days. Information is not available to permit any statement that the patient's attack is materially shortened. Also, statistically it has not been possible to compare the treated patients with a similar control group to determine the relative frequency of the occurrence of complications.

In the chronic conditions, as illustrated by sinusitis, bronchitis, chronic rhinitis, asthma, and allergic rhinitis in which symptoms are frequent and last over months or years, the value

of inhalations is judged by the symptomatic relief obtained during the treatment and the length of freedom from difficulty following the treatment. Improvement in symptoms occurred in approximately 70 per cent of the patients with these conditions even though the average number of treatments, as indicated in Table 2, was small. The relatively better results obtained from a longer period of treatment, as shown in Chart 1, suggest the possibility that many patients who showed no change might have benefited if they had taken a longer course of treatment.

Among the patients treated were 50, or 6.9 per cent, who had taken a course of treatment during a previous season. Approximately one-half, or 24, of these patients took the treatments for sinusitis, which is so frequently characterized by recurrent attacks of acute or subacute nature.

#### The Comfort of Inhalation

Patients who have required either surgical treatment or repeated hypodermic injections all remarked on the comfort and freedom from pain associated with inhalations. This factor is particularly important in the treatment of children, for patients as young as 6 years of age learn to take the treatment without fear as soon as they realize that they are not going to be hurt. This was very evident in the children treated for bronchial asthma. It is gratifying to the adult patient also to obtain relief from the pain and congestion of a sinus condition without the irritation of more pain in the course of treatment.

#### Treatment Reactions

In the course of treating 1,055 patients, only three reactions have occurred which require consideration. One case was that of a woman patient, 33 years of age, who came for treatment of pain associated with a sinus condition. She was given chlorenan for five minutes and said that she felt dizzy, faint, and numb. After resting a few minutes, she continued the treatment with table inhalation. Then a few whiffs of chlorenan produced a similar feeling so other medications were substituted, and she showed no further reaction. Case 9, as reported above, had an acute asthmatic attack following a cabinet treatment which was relieved by a direct inhalation of epinephrine chloride. She continued her course of treatment without any recurrence of these symptoms. It is necessary to be prepared to treat an acute paroxysm in any asthmatic patient, for one may occur occasionally in the treatment room either before or during treatment. The development of a headache, palpitation, and tachycardia following the use of medications containing epinephrine occurred in one patient.

end of the course of treatment her voice sounded normal, and she had no cough.

This patient's case is the chronic type and was classified as obtaining marked relief.

Case 13.—A 30-year-old man had "cold in throat" for four days with coughing attacks at night and with nearly complete loss of voice.

From December 15, 1939, to December 28, 1939, he had six treatments using the cabinet followed by five minutes of jodirenan by mask. After the third treatment the voice was improved and coughing attacks at night were less severe. Then for a week he had no treatments and his voice became more husky. He took three more treatments and at the end of the course, his voice was nearly normal and cough much less troublesome.

He represents the acute type. His relief was listed as moderate.

7. Allergic Rhinitis.—This group of 25 patients is distinguished from the larger group with chronic rhinitis by the recurrence of attacks characterized by watery secretions from the nose, congestion in the nose, and considerable sneezing occurring without any seasonal regularity.

It was necessary in this group to vary the treatment, and because of the small number, no program can be suggested for regular use.

The response to treatment was not consistent and likely depended on the freedom from the causative irritant. Five patients had only temporary relief although they took an average of 7.2 treatments; 8 had moderate relief, taking an average of 9 treatments; and 5 had marked relief with an average of only 9.6 treatments. When relief was obtained, the watery secretion diminished or disappeared, the breathing through the nose was free, and sneezing was absent.

Case 14.—A young woman 20 years old had periodic difficulty of the type previously described for two years.

From June 6, 1938, to June 27, 1938, she took 13 treatments, using the cabinet followed by chlorenan by mask. After five treatments, only momentary relief was noted so two drops of epinephrine 1:1,000 were added to the chlorenan. After three treatments of this type there was less nasal discharge, and breathing was less difficult. At the end of the course, symptoms were only minimal.

On July 9, 1938, the patient reported that she had had no recurrence since the treatment. On May 20, 1939, she stated that she had been free of any trouble during the winter. In August, 1939, another report stated that she had had no return of the above symptoms to date.

The occurrence of the attack which was treated in June, 1938, could be associated with pollen except for the history of its occurrence at various seasons for the preceding two years. She was classified as receiving marked relief.

Case 15.—A 42-year-old woman gave a history of hay fever during ragweed season. During the rest of the year she had sneezing attacks nearly every

forenoon and frequently once or twice during the night,

From January 25, 1939, to January 31, 1939, she took five treatments, using table inhalation with nasal outlet, chlorenan, and glycirenan by nose. Adrephine inhalant was also used twice. During the treatment she was free from the sneezing attacks at night, and they occurred less frequently during the day. One month later the patient reported that the relief obtained had continued to date.

While this patient took a relatively short course of treatment, she experienced some relief and was classified as showing moderate improvement.

8. Hay Fever.—A small group of 16 patients with classical histories of seasonal attacks characterized by sneezing, burning of the eyes and nose, lacrimation, and watery secretion from the nose were followed mainly during the acute phase of the condition.

As in the patients with allergic rhinitis, various combinations were used. The Hathorn or Geyser water seemed to increase the congestion, so they were regularly treated with either glycirenan or jodirenan by nasal tips and adrephine inhalant.

The response to treatment was generally immediate relief, followed by some diminution in the sneezing and nasal excretion during the rest of the day. Eight patients experienced moderate relief and took an average of 5.9 treatments. Real benefit was noted in a few patients who were able to follow the treatments during the entire period when symptoms occurred.

Case 16.—A man, aged 25, who had had hay fever in August and September for a number of years, gave a strongly positive test for ragweed.

From August 15, 1938, to September 23, 1938, he took eighteen treatments of glycirenan and chlorenan. He experienced relief of severity of symptoms, sneezing attacks occurred at less frequent intervals, and rest was disturbed less frequently than in previous years.

From August 8, 1939, to September 7, 1939, he took twelve treatments using adrephine inhalant and glycirenan. The excessive lacrimation and sneezing which were present at the start were partially relieved. He continued during the remainder of the period in moderate comfort.

This case illustrates the possibility of modifying the severe symptoms in a patient who is not able to escape the ragweed by travel. He was classified as obtaining moderate relief.

Case 17.—A man of 45, took five treatments from August 28, 1939, to September 5, 1939, during an acute attack of hay fever. He reported that the sneezing attacks were less frequent while he was under treatment.

The number of treatments taken by this patient was not sufficient to obtain a prolonged effect. He was classified as temporarily relieved.

## ANTEPARTUM NECROSIS OF THE ANTERIOR LOBE OF THE PITUITARY GLAND

J. Sportiswood Taylor, M.A., M.D., Kingston, New York, and Edward F. Shea, M.D., Stone Ridge, New York.

THERE are few fields open to the medical Linvestigator more fascinating than the study of the role of the anterior lobe of the pituitary gland in the maintenance of normal body functions, and the changes in these functions when the lobe is involved in disease processes. Those most familiar diseases resulting from changes in the hypophysis are due either to atrophy of the anterior lobe or to hyperplasia and tumor growth. The clinical syndromes which develop from such changes are usually gradual in onset and the patients seldom present a dramatic picture like that seen, for example, in acute hemorrhagic necrosis of the adrenals. Nevertheless, alterations which produce the most alarming signs and symptoms do occur in the pituitary gland, and they give rise to a clinical picture which is truly a dramatic one. Extensive traumatic injury to this gland constitutes one such group of alterations, but another group of acute lesions found in association with pregnancy, labor, and the puerperium is more interesting because the cause of these latter lesions is not understood, and the treatment of such patients is so uncertain.

Over a period of one year we had the opportunity of studying three very baffling obstetric cases. The mothers died, and in each instance at the time of death the cause of the difficulties was not suspected. The deaths were ascribed to obstetric shock on the basis of internal hemorrhage, in spite of the absence of objective evidence of such hemorrhage. The clinical course of each of our patients was almost precisely like that of the other two in what appear to be the essential details; and, because of this similarity, we have little doubt that the first one, upon whom no postmorten examination was performed, had a subtotal acute necrosis of the anterior lobe of the pituitary gland such as was demonstrated at necropsy upon the other two.

H. L. Sheehan<sup>1-4</sup> and his coworkers in Glasgow have studied this acute necrosis of the anterior lobe of the hypophysis quite intensively and have observed a rather large number of instances in the past ten years. These investigators are thoroughly convinced that such necrosis is the

result of what they call "hemorrhagic collapse," which occurs shortly after delivery. Most of us have been ready to accept this interpretation of the cause of this necrosis, and it seems almost heretical to question their conclusion. However, observations upon the cases we have observed and a study of the reports on like cases have led us to seriously question not only the episode of "hemorrhagic collapse" as the causative factor in this necrosis, but also to doubt the time of onset as postulated by the Glasgow group.

We believe that Sheehan's "hemorrhagic collapse" following delivery is the result of this necrosis in the pituitary gland rather than its cause, and, furthermore, it would seem that instead of this being postpartum necrosis it is in fact antepartum necrosis.

#### Summary of Clinical Observations

Case 1.—E. L., a white primipara, 27 years old, began her last menstrual period on January 28, 1940. She developed no untoward symptoms during her pregnancy until the onset of labor at 1:30 A.M., November 27, 1940, three weeks after the estimated date of confinement. Upon admission to the Kingston Hospital she was in good condition. Labor pains were mild and irregular, the membranes were intact, her blood pressure was 120/80, respirations were normal, and the pulse was 85. The fetal heartbeat was best heard in the left lower quadrant; its rate was 140, and the rhythm was regular. A trace of albumin and a few red blood cells were present in an uncatheterized specimen of urine, and the blood Wassermann was negative.

For ninety-three hours labor pains were never satisfactory in frequency, duration, or intensity, and at the end of this time the cervix was hardly more than effaced. Sixty hours after the onset of labor the patient lost the ability to void spontaneously and shortly thereafter began to show signs of nervous exhaustion, exhibited largely by a growing antipathy toward her mother and an unwillingness to cooperate with the nursing staff. The blood pressure was at this time 110/80 and the pulse was 95, but there was no apparent change in the fetal heart. At seventy-five hours backache developed and meconium was observed in the mucous show, but the exact time of rupture of the membrane was not determined. Discouragement and apprehension were marked at eighty hours, and a little later the patient felt faint when out of bed; she would no longer take food, and water had to be forced. After eighty-nine hours of labor the fetal heartbeat became weak and irregular, and there were large amounts of meconium in the

Director, City of Kingston Laboratories, and pathologist to the Benedictine and Kingston Hospitals, Kingston.

Attending physician to the Benedictine Hospital, Kingston and Stone Ridge, New York.

The administration of the Geyser water at 95 to 98 F. may cause increased congestion in the nasal passages if they are already partly blocked. It can be prevented by giving the treatment at 85 to 88 F.

In the number of patients treated these few untoward reactions to treatment bear evidence of the safety of inhalation therapy.

#### The Rationale of the Treatment

The patients treated in the inhalation department may be divided into two groups, first. those with acute or chronic infection in the respiratory tract and, second, those with allergic conditions. The symptoms are dependent largely on the reaction of the patient as host to the infectious or allergic agent as invader. Inhalation therapy is considered effective by its influence on the mucous membranes of the respiratory tract which are subjected to physical-chemical influence of the ingredients of the mineral waters and medications. In their finely divided state they are distributed to all surfaces which are reached by the inspired air. In addition, certain medications such as epinephrine are absorbed and produce systemic effects.

More study is required to determine the physical-chemical influences on the mucous membranes, but the saline elements in the waters are solvents of mucus and soothe the irritated membrane, and the carbon dioxide acts to improve the circulation in them. The observations of Holinger and his coworkers support this conclusion. It is, therefore, evident that the benefits obtained from the inhalation of these agents is produced by their effect locally on the lining membranes of the respiratory tract and by systemic effects following absorption.

#### Relation of Inhalation Therapy to the General "Cure" Regimen

The large percentage of patients treated in the inhalatorium were following a "cure" regimen in which they took the mineral waters internally, utilized the various treatments in the bathing establishment, took regular amounts of exercise, and had definite periods for rest. The importance of this well-rounded program in relation to the inhalation therapy is recognized. The improvement of general health has a beneficial influence on local respiratory disorders. Also the

treatment of an irritating rhinitis, sinusitis, or bronchitis is necessary in order to obtain the maximum results from the "cure" program.

The fact that the majority of patients treated are at the Spa for from only two to four weeks makes it difficult to determine the prolonged results of this form of therapy.

#### Summary and Conclusions

1. A study of the results obtained in the treatment of 738 patients with inhalation is presented. The conditions for which the treatments were given included sinusitis, coryza, bronchitis, chronic rhinitis, bronchial asthma, laryngitis, allergic rhinitis, hav fever, and pharyngitis. The treatments consisted of the inhalation of finely nebulized saline-alkaline, naturally carbonated mineral waters, and medicated oils.

Marked relief of the condition treated was noted in 38 patients, or 5.2 per cent of the total; moderate relief in 468 patients, or 63.4 per cent; temporary relief in 46, 6.4 per cent; and no change in 185, or 25 per cent.

3. The relief obtained bore a definite relation to the number of treatments taken. In acute conditions, from four to six treatments were necessary to obtain consistent improvement while in chronic conditions, twelve to fifteen treatments were usually required.

4. Inhalations are taken without discomfort, which is an important factor in therapy.

The safety of the therapy can be stressed. Reactions of significance occurred in only three patients. One may possibly have had a sensitivity to chlorenan, one developed an acute asthmatic paroxysm, and one noted a general reaction to epinephrine.

6. Attention to the general condition of the patients suffering from respiratory disorders is an important factor. Inhalations have a definite place in the general "cure" regimen of a spa.

vaginal discharge. The situation appeared to demand operative interference, so that after ninetythree hours of labor a difficult high forceps delivery was performed, resulting in the intrapartum death of a 10-pound baby. The placenta was expressed intact soon after delivery, but the uterus did not contract well, vomiting began, the patient's color changed to that of a dusky cyanosis, and hemorrhage from the vagina began and was rather profuse. Small cervical lacerations were repaired without any appreciable effect on the uterine hemorrhage. Shortly the pulse was found to be very rapid, weak, and irregular, and its rate could not be satisfactorily estimated. Profound shock was evident thirty minutes after the child was known to be dead. Moderate vaginal hemorrhage continued, and the uterus remained relaxed even after the administration of gynergen and in spite of continuous massage of the fundus. Two hours after delivery approximately 600 cc. of blood had been lost but large quantities of intravenous fluids and a whole blood transfusion of 500 cc. had been given. The bleeding was stopped but the collapse continued, coma deepened, and death resulted eleven hours postpartum. Necropsy was not performed upon either the mother or the child.

Case 2.-H. Van W., a 30-year-old primipara, started her last menstrual flow on March 15, 1940. Except for a rather marked change in her desire for certain types of food and a fear of dying in childbirth there were no observed difficulties during the period of gestation other than its duration of over three hundred days. Irregular and mild labor pains began January 12, 1941, and at no time did the uterine contractions develop the usual frequency and intensity. During the first forty-eight hours of a desultory labor many vaginal examinations were done, but there was no evidence of sensis until after this period had elapsed. Then signs of sepsis appeared and tended to becloud the subsequent clinical picture. A few hours later the fetal heart rate had increased to 160, and the patient felt chilly. After fifty-six hours of labor the temperature was 103.6 F., the pulse of the mother was 140, and her respirations were 32 per minute. At fifty-eight hours the baby died in utero. Within forty-five minutes the mother was found in profound shock. Her blood pressure was 90/60, the pulse rate was 116, and there was marked evanosis with evidence of impending coma. Large quantities of clear fluid were vomited on several occasions. There was no vaginal bleeding, but three whole blood transfusions of 500 cc. each were given during the next twelve hours without any appreciable benefit to the patient. Twenty-four hours after its death the 10-pound 9-ounce baby was delivered by forceps. During delivery the blood pressure continued to be approximately 80/50 but subsequently it fluctuated downward, the pulse gradually became imperceptible, and death ensued ninety-three hours after the onset of labor and thirty-six hours after the death of the baby in utero. No significant bleeding followed delivery, and many supportive measures in no way appeared to retard her downward course.

Case 3.-M. C. was a 34-year-old white primi-

para whose last menstrual period began February 17, 1941. One month later her appendix was removed but otherwise the pregnancy was uneventful. Labor began at 4:00 P.M., November 23, 1941, at term. She had entered the Benedictine Hospital twenty hours earlier because of back pains. With the onset of labor the blood pressure was 128/80, the temperature, pulse, and respirations were normal. and the fetal heart rate was 140. The progress of labor was exceedingly slow, with the pains and uterine contractions widely irregular and ineffective. After sixty-five hours the membranes were ruptured, but this event in no way seemed to stimulate uterinc contractions. At the end of seventy-two hours the patient had begun to vomit large quantities of clear fluid, was extremely restless, and often screamed without sufficient reason for doing so. Soon she was uncooperative and would not stay in bed. The fetal heart did not change its rate or rhythm. After ninety-three hours of labor a live baby of normal size was delivered by cesarean section, and the child remained well. During the operation the blood pressure ranged between 130/80 and 150/80, but thirty minutes after the umbilical cord was tied the blood pressure of the mother began to fall, and this fall progressed in spite of the fact that plasma and whole blood transfusions were being given at the time. Shortly vaginal bleeding began but was readily stopped by a uterine pack before any significant amount of blood was lost. After two hours the pulse was weak and irregular and the blood pressure had fallen to 70/46, this fall having occurred while the second 500 cc. whole blood transfusion was under way. After five hours of collapse the administration of adrenal cortical extract restored the blood pressure to 128/78 and the character of the pulse improved, but this improvement lasted only a few hours. The last twenty-four hours of life were spent in profound collapse which was accompanied by cyanosis and a very high fever, none of which responded to the administration of oxygen, parenteral fluids, and general supportive measures. Death occurred fifty-six hours after the birth of the baby, one hundred and forty-nine hours after the onset of labor.

These three women were white, 27, 30, and 34 years old, respectively. Two had passed their estimated periods of confinement by many days. Their courses of labor were long and sluggish, with never really satisfactory uterine contractions of significant duration. The two babies which were past term were much larger than the usual term child and they produced differing degrees of dystocia, but the attending obstetricians thought manual intervention to be imperative only after signs of impending danger to the mother had developed. Two were delivered by high midforceps, and the other by cesarean section. The first resulted in intra-partum death of the baby; the baby of the second mother died in utero many hours before the forceps delivery; but the third child was delivered by cesarean section alive, and has remained well. In no instance was there massive bleeding following delivery; in fact, none of the patients lost more blood within the first hour postpartum than was well within the upper limits of such loss in otherwise uneventful childbirth.

During the early stages of labor the attending physician in each case felt that he was dealing with just another of the many patients who are slow to develop normal labor pains with adequate uterine contractions. After what would appear to be sufficient periods of watchful waiting, signs began to appear which indicated that they were not just cases of slowly developing labor but of something far more serious. The patients showed signs of exhaustion without having gone through any of the usual ordeals of an exhausting labor. They became increasingly uncooperative, restless, and apprehensive, observations which were disturbing and doubtless led to more vaginal examinations than should have been done. It is significant that the blood pressures remained at the level they were on admission to the hospital until many minutes after delivery in two instances, and until a similar period after the death of the infant in utero in the other

For the first thirty minutes or so after delivery of the two patients whose children were alive at the time the operative procedures were undertaken their condition seemed fair, but shortly thereafter they were in profound collapse. The pulse was extremely rapid and of very poor quality; the blood pressure had dropped for the first time and was so low that satisfactory estimations often could not be made, and both patients were semicomatose. A similar episode occurred in the other patient shortly after her baby died in utero. These periods of collapse followed the cessation of the fetal circulation through the placenta in such a striking fashion that it would seem that this halt in the fetal circulation might well have been the precipitating factor in the collapse. During the collapse episodes of the two patients who had delivered their babies before the collapse, the uterus relaved, vaginal bleeding began and resulted in moderate loss of blood, but the loss did not equal the quantity of intravenous fluids that had already been given to one of these patients. From this point on heroic supportive measures, including whole blood and plasma transfusions, parenteral fluids, adrenal extract, and oxygen helped for very short periods only.

The other patient, whose baby died in utero, ran almost precisely this same course, with the exception that there was absolutely no bleeding associated with the first period of collapse which followed shortly after the death of her child.

The dead baby was delivered many hours later as a last resort, but this in no way appeared to alter the mother's downward course. The three patients were dead eleven, thirty-six, and fifty-six hours, respectively, following the cessation of the fetal circulation.

The foregoing observations have convinced us that necrosis of the anterior lobe of the pituitary, in many instances at least, occurs at or about the time of the onset of labor and, moreover, that the "hemorrhagic collapse" of Sheehan may be the result rather than the cause of this necrosis. To summarize the evidence:

First, the sluggish and very ineffectual uterine contractions evident early in labor and persisting until death.

Second, signs of impending shock in the mother before postpartum bleeding of any consequence had occurred, and therefore before what Sheehan would call the episode of "hemorrhagic collapse."

Third, failure of the postpartum uterus to contract adequately at any time and its subsequent relaxation during the periods of collapse, due perhaps to a deficiency of pituitary hormones. It appears that this failure of the uterus to contract would account for the uterine bleeding.

Fourth, the collapse of the mother approximately one-half hour after the fetal circulation was interrupted either by tying the umbilical cord or as the result of fetal death in utero. In fact, the most convincing observation was that precisely the same clinical course resulted from fetal death in utero and was unaccompanied by any hemorrhage whatsoever.

### Summary of Pathologic Studies

The significant findings upon postmortem examination of our two cases are so nearly alike that they are easily described together. Of course, the results of the forceps delivery in one patient and those of the cesarean section in the other patient were different, but in neither was there more than the usual evidence of trauma and slight hemorrhage into the tissues. Both uteri were large and obviously relaxed. No sources of vaginal bleeding could be found other than the placental sites, which were free of adhering remnants. Both bodies were somewhat edematous, perhaps from excessive parenteral fluids, and there were signs of sepsis in the body of the patient whose clinical course suggested such sepsis. Scattered abscesses in the liver and adrenals in this body contained various kinds of bacteria, suggesting an almost complete breakdown of tissue resistance.

In each case the pituitary gland was seen to bulge through the opening in the sella diaphragm, and this dural covering was lifted upward and had a convex surface rather than the usual flat or concave one. When the glands were fully exposed they were found to be double or thrice the normal size. One measured 2 by 1 by 1 cm. while the other was more nearly spherical and was 1.5 cm. in diameter. Their cut surfaces were yellowish-brown, and the parenchyma protruded and tended to roll over the edges of the tense capsules, in sharp contrast to the normal-appearing gland. The posterior lobes were compressed but otherwise unchanged.

Microscopically there was seen widespread necrosis of the glandular elements of the anterior lobe with most of the cell outlines no longer distinguishable. The intrinsic blood vessels were intact and very markedly dilated, but no thrombi could be recognized in any of them. In each of the anterior lobes the only normal-looking cells were found as a very thin layer just under the capsule and in the region of the stalk where this portion protruded through the sella diaphragm. Different stages of disintegration of the cells were evident, and the older-looking areas appeared to have been initiated several days rather than a few hours before death.

#### Comment

The suggestion has been made by several students of pituitary necrosis seen in association with the gestational period that it may be the result of an exaggeration of the normal pregnancy changes in the parenchyma. The assumption is made that an ischemic necrosis results merely from the collapse of the anterior lobe's intrinsic blood vessels. This quite simple explanation might well be the correct answer, but we prefer to hold to the position that, as

yet, the cause of this necrosis is uncertain. Sheehan believes he can judge accurately the duration of such necrosis but we doubt his ability to do so and frankly admit that we cannot do more than roughly estimate it.

If this necrosis actually begins before the period of "hemorrhagic collapse" it might be asked why these individuals do not go into collapse before delivery. We believe there is just enough hormone gaining access to the mother's blood stream from that of the living child to prevent collapse and that when the circulation through the cord is interrupted the minimum maintenance supply of hormone to the mother is shut off and collapse occurs. This belief is based solely on the clinical observations recorded above.

It is hoped that the future will enable all of us to recognize these cases in time to attempt substitution hormone therapy, which holds promise of sustaining these patients until sufficient regeneration of the anterior lobe can take place for the maintenance of life or perhaps until the mother can make some such adjustment as do the Houssay dogs. If these deaths can be prevented by the administration of hormones, Sheehan has already pointed the way toward the restoration of health in nonfatal cases, for he has reported great improvement and, in fact, actual cures in women who subsequently became pregnant.

#### CEREBRAL PALSY VICTIMS NEED NATIONAL HELP

Cerebral palsy, more devastating in its crippling effects than infantile paralysis, affects seven out of every 100,000 of population, yet children so crippled are the most neglected group of all handicapped children.

This statement is made by Paul A. Salisbury, pharmacist's mate, United States Navy, writing in the April issue of Hospitals, journal of the American Hospital Association. Salisbury in civilian life was director of physical therapy at Huntington, West Viceping, Orthogodic Hospital

Virginia, Orthopedic Hospital.

While the March of Dimes and the National Foundation for Infantile Paralysis, together with the work of Sister Kenny, have stirred the imagination and won the support of the public with reference to infantile paralysis, Salisbury writes, most people know nothing of cerebral palsy, its incidence, or the great need for care of its unfortunate victims.

The result of damage to the brain sustained either before, during, or after birth, cerebral palsy afflicts each year seven children born in every 100,000 population unit. Of this number, one will die during infancy or shortly after, Salisbury points out. About 25 per cent of the surviving children are too severely handicapped to be rehabilitated, but it is estimated that in this country there are 70,000 cerebral paralytic children who can be rehabilitated.

"This does not mean they can be completely cured," according to the author, "but that the majority of them, with proper medical and educational methods, can become partially or wholly self-sufficient instead of remaining helpless invalids."

While only four states have what may be called an adequate state-wide program for cerebral palsy, the only permanent solution is for each state to establish a centrally located treatment center and for each city or county to establish cerebral palsy societies, the author believes, all banded together by a national parent organization to carry on a program of orthopaedic treatment, specialized physical therapy and occupational therapy, special teaching methods, sight and hearing correction, speech correction and training, and vocational guidance.

## THE PREVENTIVE ASPECTS OF CORONARY DISEASE AND MYOCARDIAL INFARCTION

MILTON PLOTZ, M.D., F.A.C.P., Brooklyn

FOR hundreds of years the medical profession has approached the problem of the treatment of arteriosclerosis and the other degenerative diseases with comparative hopelessness. In this paper it is proposed to call attention to the fact that a certain number of cases of coronary disease—or, more properly, myocardial infarction—have preventive aspects; that once the attack has occurred, death may sometimes be averted; but, most important of all, to emphasize that one must approach an important field in preventive medicine with hopefulness rather than despair. In short, our attitude toward this disease must keep abreast of our newer concepts of its physiology and pathology.

About two years ago, when this study was started, some of our colleagues were skeptical of the idea of coronary disease having preventive possibilities. Yet we have been treating angina pectoris since the days of Heberden in 1768, and even before, from a prophylactic point of view. What else have we been doing when we advise the anginal patient to restrict his activities, to keep calm, to avoid tobacco, to keep his weight down, to take an occasional drink of whisky? It is true that we have been trying to reduce the severity of the individual attack but, consciously or not, we have felt that we could prolong his life; in other words, that we could postpone the day, which we felt would inevitably come, when his life would be cut short by coronary disease.

The first important consideration is that there are certain people who are especially likely to have coronary artery disease and that these are the ones who must be specially guarded by their physicians. In the present state of our knowledge we have no way of being sure which people already have damage in the coronary arteries. Even the electrocardiogram, which is our most valuable guide, measures not the changes in the coronary arteries but what takes place in the heart muscle. Therefore, all of us know of patients who have died of coronary thrombosis a day or two, or even the same day, after an electrocardiogram was reported as normal. Nevertheless, there is some degree of pred-

ictability and it is statistically certain that some people are more vulnerable than others.

First, there is the patient who has already had one attack of coronary thrombosis. The chances of his having another are very considerable indeed. Next, there is the man with angina pectoris. The likelihood of his dying from coronary disease is very great. Next, there are middle-aged and aged people with definite electrocardiographic evidence of heart damage without symptoms. These are often the ones who will die of some cause entirely unrelated to the heart. Yet, at autopsy, extensive damage to the coronary arteries or heart wall may be found. Nevertheless, given certain conditions, their coronary arteries will fail. Somewhat less vulnerable but still requiring special vigilance are patients with hypertension; with diabetes; with myxedema; with polycythemia; elevated blood cholesterol from any cause. All of these need watching and need to be guarded.

Guarded against what? One fact is of fundamental importance at this point, and that is that coronary thrombosis practically never occurs except in an artery which has already been damaged; it does not occur suddenly in a normal artery. Can anything be done, then, about actually preventing the formation of the atheroma in the arterial wall? In the light of our present knowledge, almost nothing, and yet directions for future research are becoming quite clear. The atheroma is almost pure cholesterol and its formation is concerned in some way with the metabolism of lipoids. In all likelihood, the wall itself is unable to get rid of the cholesterol as effectively as formerly and it accumulates as atheroma. Less likely, but still possible, is that cholesterol may be present in unusual amounts or in unusual states in the blood stream and that diet may be responsible in some way. Animal experiments, in spite of the fact that atherosclerosis can be produced experimentally in some animals, are still not very helpful. Nevertheless, the almost total absence of this disease in other races, such as the Chinese, suggests the possibility of dietary factors which need investigation. What is certain, however, is that excessive accumulations of cholesterol in the blood are harmful and predispose to coronary disease. The incidence of atherosclerosis is very high in myxedema, diabetes, and nephritis. Myxedema and diabetes, where the blood cholesterol is high, require

vigorous treatment even though the patient may present no symptoms and have no complaints. Otherwise the incidence of atherosclerosis must remain as shockingly high in these diseases as it now is.

The next pathologic fact of importance is that coronary thrombosis is not usually a sudden We have already seen that it must be preceded by an atheroma, but some further change must take place in the atheromatous plaque or a thrombus will not form. The atheroma may rupture and the debris which comes out may be washed downstream and plug the artery at a narrower point. Or a thrombus may form at the rough area of rupture. Another possibility is that there may be, as the result of a sudden rise in blood pressure or rupture of capillary walls, hemorrhage into the plaque so that the caliber of the artery is sharply narrowed and the blood flow through it sharply reduced. If the flow of blood is very much diminished, the heart muscle may die even without thrombosis in the artery. Then again, a thrombus may form at the plaque and close off the blood supply completely. It is in this stage, when a change has occurred in the wall of the vessel but the circulation has not been completely cut off, that the patient may be helped and permanent damage possibly averted. This may not be the solution, . but it would be wise to continue the search for some safe method of maintaining the blood pressure in such cases.

This stage can sometimes, I think, be recognized clinically. The dramatic picture of terrifying pain, shock, changes in the cardiogram, etc., are only the final act in the drama of coronary thrombosis. Preceding this, in many cases, there is a prodromal stage of precordial pain, resembling coronary pain but yet so atypical that it is often mistaken for other conditions. It is like a prolonged, atypical attack of angina pectoris, relieved little, if at all, by nitroglycerin, and is really a reflection of reduced coronary circulation and anoxia of the heart. In a patient who falls into one of the vulnerable categories mentioned before, such an attack should lead one to suspect an impending coronary thrombosis. A man who suddenly develops angina pectoris for the first time should be put in the same category.

A typical example of what is meant is the patient with known angina pectoris of months' or years' standing. He has established for himself a pattern of pain of typical onset, characteristic distribution, and known methods of relief. One day the pain becomes more severe, conforms less to the known pattern, and is no longer relieved as effectively by nitroglycerin or resting. There is no leukocytosis, fever, or shock; the pain is not usually agonizing and there are no characteristic

changes in the electrocardiogram. This patient's coronary circulation has diminished considerably. Some of these cases will subside; others will go on within hours or days to infarction. At this point, the final crushing blow has not yet been delivered. The affected heart muscle has not yet died.

The important part of treatment is that this patient should be treated exactly as though he had a cardiac infarction. Every effort should be made to do three things:

1. To decrease the work of the heart. This is accomplished by putting the patient at complete bed rest. He need not stay in bed long. If infarction does not take place, five to fourteen days of recumbency is all that is necessary, but that amount should be a minimum. The presence or absence of leukocytosis, increased sedimentation rate, electrocardiographic changes, etc., will be our therapeutic criteria.

2. To increase the coronary circulation by using papaverine. Its effect may be slight but it is wise to employ it.

3. To increase the collateral circulation so that infarction may be avoided or the area made as small as possible. Bed rest and increasing the coronary flow help this. Also, there may be considerable spasm of these neighboring vessels because of the pain of the attack and morphine should be employed freely to stop the pain. It has been well established that in occlusion of the coronary artery necrosis of heart muscle is less likely to occur if pain is absent. That complete occlusion of a vessel may not result in an infarct, or even be clinically recognized, is a matter of common experience to every pathologist and cardiologist. Patients should be warned about the use of nitroglycerin in this stage. If nitroglycerin does not relieve pain promptly, it should not be used again. The repeated use of large doses of nitroglycerin in an effort to relieve the pain lowers the blood pressure and increases the possibility of infarction.

The third aspect of this problem, and the one of most immediate clinical application, is the fact that the heart muscle may die without coronary occlusion. If the head pressure in the coronary arteries is reduced sufficiently, even with normal coronary arteries, the flow may not be enough to keep the muscle alive. This relative insufficiency is even more likely to occur in a patient whose coronary circulation is already bordering on insufficiency; in other words, the vulnerable classes I have described. Since the pressure in the coronary arteries is dependent on the aortic pressure, any sharp and prolonged reduction of blood pressure may be fatal to such a patient. Therefore, he must be protected against such events as shocking operations, anesthesias, such as spinal, which lower the blood pressure, and severe hemorrhages in which ordinarily one would not be too much concerned about the drop in pressure.

Here are practical illustrations. A patient with angina pectoris was operated on for acute appendicitis and spinal anesthesia was employed. The blood pressure dropped from 150/90 to 90/40 in spite of anything the anesthetist could do for more than half an hour and the patient died several hours later. There was a large area of infarction but the coronary vessels were patent, although narrowed. On another service, five patients died in this way in one year after relatively mild operations in which general anesthesia was employed but in which the blood pressure was reduced during the time of operation.

During the past year we have seen a man of 46 in whom a previous cardiogram had revealed myocardial damage. This man had a severe hematemesis from a bleeding duodenal ulcer. In accord with usual practice in these cases, the blood pressure was allowed to drop from 146/100 to 92/60 for a period of forty-eight hours without transfusion. At the end of that time the patient had a myocardial infarction. The lesson to be drawn is that patients in vulnerable groups must not be permitted to have their blood pressures drop sharply and to remain at low levels too long. Patients past 40 with gastric hemorrhage should have transfusions earlier and should, perhaps, be treated surgically sooner than the young in cases of continued hemorrhage and hypotension. any case, anemia, of itself, throws an added burden on a myocardium to which the oxygen supply has already been lowered.

There is an important corollary to this argument. Let us take the case of a patient who has an established coronary thrombosis and is in shock. Usually little effort has been made to treat the hypotension of shock because of the danger of increasing the work of the heart. In general, I am in agreement with this attitude. Nevertheless, the danger of rupture of the heart is almost negligible on the first day or two when severe shock is present On the contrary, permitting the blood pressure to remain at dangerously low levels further reduces the coronary blood flow and reduces the possibility of effective collateral circulation. The mortality rate in cases with severe shock is shockingly high not only because major vessels are likely to be involved but because of the added handicap of the low blood pressure. For the past two years I have employed slow plasma transfusions in those patients in whom the systolic blood pressure has fallen below 90. While it is still too early to report definite figures, we feel that several lives have been saved by preventing the coronary head pressure from falling too low. It is difficult to evaluate results, since only the larger infarctions have pronounced drops in blood pressure and, in any case, it is difficult to have comparable control cases.

I have indicated several ways in which patients with failure of the coronary circulation may avoid death or serious consequences. There are numerous other methods, as yet too hypothetic or controversial to be included in this short paper. For example, there is the possible use of anticoagulants in the stage of impending thrombosis. We have used this method without definite results so far. There is the question of avoiding fatal complications such as changes in rhythm or embolization, either from the heart or from thrombosis in leg veins. There is the work, only just begun, on the use of chemical agents which act as catalysts to increase the efficiency of the use of oxygen by the heart muscle. There is the necessity for avoiding the use, in susceptible patients. of any drug, such as pituitary extract, which constricts the coronary arteries.

All of these, and others, must be omitted at this time.

To summarize: I have tried to show that certain categories of patients are pecularly susceptible to coronary disease; that coronary occlusion is a gradual process, not a sudden one, and that its prodromal stages can sometimes be recognized; that the heart muscle may die without complete coronary occlusion; that measures may be employed to reduce the likelihood of complete death of the involved muscle. More than this, however, I have tried to present an attitude, a point of view; to show the way which must be followed in the medical thinking of the future if the problem of coronary disease is to be solved.

#### Conclusions

- 1. Certain groups of the population are especially susceptible to the danger of coronary disease. These groups require special protection by the physician.
- 2. Myocardial infarction and coronary thrombosis are the end results of a chain of pathologic events. Proposed methods of interrupting the chain are discussed.
- 3. The premonitory symptoms of impending death of the heart are often marked enough to be clinically recognizable.
- 4. A more vigilant and optimistic approach to the study of coronary disease is needed.

## CESAREAN SECTION

## Advantages and Disadvantages of the Present-Day Types

JAMES P. MARR, M.D., New York City

ESAREAN section has undergone so many variations during the past forty years that we now have at our disposal several distinct types suitable for handling obstetric problems necessitating a suprasymphysial delivery. These we may classify as the classical, the low-flap, the Porro, the peritoneal exclusion, and the extraperitoneal cesarean. It is, of course, an axiomatic truth that the choice of procedure must rest with the experienced obstetrician, whose conclusions are in turn based on sound statistical findings.

I will begin my presentation by referring briefly to the classical cesarean section.

The indications for this type of operation remain practically unchanged; namely, in elective clean cases, placenta praevia, abruptio placentae, repeated cesarean section where sterilization may be deemed advisable, and in instances of dystocia produced by uterine, ovarian, or bladder neoplasms.

It is distinctly contraindicated in those cases of prolonged labor in which the element of infection, due to ruptured membranes or repeated vaginal examinations, renders it unsafe. And we must not brush aside the fact that the classical incisional scar carries a 4 per cent incidence of

rupture in subsequent pregnancy.

Because of the simplicity of the classical cesarean from a technical angle, efforts have been made to reduce its disadvantages to a minimum by improvements in technic as well as by the introduction of a number of changes. Among these changes are the lower longitudinal incision, accurate approximation of the uterine wound, reinforced by serosal coaptation, and exclusion of the peritoneal cavity by adequate padding. Of these changes, the use of the transverse incision in the lower segmental fundal junction is worthy of recording. This method, which has been adopted by E. M. Hawks, may prove to have all the advantages of the low-flap cervical operation. But despite these varied innovations the classical cesarean is not applicable in all cases, and even in the best of hands it still has a low but distressing mortality rate.

E. Porro, of Pavia, in 1877, introduced his well-known operation, since he was working in the preantiseptic age, in which he performed a supravaginal hysterectomy and bilateral salpingo-oophorectomy, leaving the cervical stump an-

Read at the Annual Meeting of the Medical Society of the State of New York, Bussalo, May 5, 1943.

chored in the lower angle of the abdominal incision by a specially devised clamp. This operation is said to have been suggested in England by J. Blundell in 1830. It was performed in America by H. Storer in 1869 for fibroids complicating pregnancy. The modified Porro, as performed today, is essentially a supravaginal hysterectomy, preceded by removal of the fetus. The cervical stump is carefully peritonized. This operation has been advocated for multiple fibroids, rupture of the uterus, uncontrollable hemorrhage, and neglected cases where there is an acknowledged infection. The maternal mortality, which varies from 10 to 20 per cent, certainly does not speak well for this procedure.

Many substitutes for this drastic operation have engaged the attention of the profession. The operation known in the literature as the Sellheim IV (1909) was an attempt to salvage the infected uterus. Sellheim created a uteroabdominal fistula, having previously extraperitonized the uterus by suturing the peritoneum to the wound edges, and then attaching the uterus to the incision. The uterus was packed with iodoform gauze.

L. Portes<sup>2</sup> resurrected the distinctly undesirable two-stage operation in 1924: that of exteriorizing the uterus and adnexa—a method advocated by S. Gottschalk<sup>3</sup> in 1909 and again in 1911. According to W. Benthin, the primary mortality was 27 per cent, and in the first one hundred operations the mortality was 11 per cent.

R. Lecoq, instead of resorting to a Porro operation, removed the uterus with the fetus and placenta in situ (1919). He performed five such operations. However, the operation was not original with him, having been performed for the first time by E. Reymond in 1911 and then abandoned. Thus it will be seen that the serious mortality rates which I have enumerated and the loss of the vital reproductive organ militated against the adoption of this procedure.

Looking back several decades, we find that the problem of the infected or potentially infected parturient woman remained unsolved at the beginning of the twentieth century, and the solution of that problem has been due, in the main, to the efforts of those ingenious German obstetric surgeons, among whom we may mention Frank. Sellheim, Latzko, Küstner, and Döderlein. Here in America, particularly in New York City, the necessity for a type of cesarean section suit-

-w-

able for infected cases was rendered obvious by the statistical report of Asa B. Davis<sup>7</sup> of the New York Lying-In Hospital (1911). In a series of 104 classical cesareans performed on potentially infected patients the mortality rate was over 16 per cent.

Krönigs and Opitz, believing that the better results from newer methods were due to the incision in the noncontractile lower segment, introduced the cervical cesarean section. After a lapse of at least ten years, this operation was evolved in America by Beck of and DeLee. DeLee introduced the descriptive term "laparotrachelotomy." Beck proposed the term "two-flap low incision," which Scott changed to "double low-flap cesarean." The latter terms have since been shortened to the simpler designation, "low-flap cesarean."

Beck, in 1920, reported 83 cases of "two-flap low incision cesarean section." In the discussions by Hirst, Norriss, Boyd, and McGlinn which followed his presentation it was pointed out that this type of operation did not solve the problem for the infected parturient. In rebuttal Beck stated that in his experience the great majority of deaths from peritonitis following a classical operation occurred as a result of extension of infection through the uterine wound despite apparent firm suture approximation. The uterus was infected and therefore the wound "broke down." But, we may ask, if the uterus was infected, was not the amniotic fluid therein also infected, and would retroperitonizing a low segment incision save the patient from a possible peritonitis? Beck gave the answer in his statistical report of the previous year: of the 19 cases managed by general practitioners and subsequently operated upon by the low-flap technic, 3 died, a mortality of 16 per cent.

Delee reported 330 laparotrachelotomies with only two deaths. But all of the patients in this large series had the benefit of careful prenatal supervision, with scrupulous observance of an aseptic conduct during labor, however prolonged. But, one might ask, how many of the 500 annual American fatalities could have been avoided by the low-flap cesarean after a labor mismanaged by an unskilled practitioner? This inadequacy of the low-flap principle was manifested in a report submitted in 1934 by O'Connor, who recorded a mortality rate of 5 per cent in a series of 133 laparotrachelotomies.

Irving, 12 too, in 1937, may have answered this question: "If the uterine contents are infected, the lower segment cesarean affords at operation no greater protection against spill and subsequent peritonitis than does the classical cesarean."

The transversely incised lower segment cesarean received its full measure of praise from the British obstetricians, Munro-Kerr<sup>13</sup> and C. McIntosh Marshall.<sup>14</sup> Without minimizing the dangers of the operation, Marshall considered it reasonably simple technically and "the only truly strategically and really surgical approach to the cavity of the pregnant uterus." He based his work on 246 lower segment operations, of which 70 were "suspect or infected cases." There were no deaths.

However, in spite of Marshall's faith in the lower segment operation, he did not trust it in 4 cases, resorting to a subtotal hysterectomy instead. He admitted to 27 infected wounds, not an alarming figure since these cases must be considered at least potentially infected and consequently a primary union was not to be expected.

Marshall, in his excellent text published in 1939, argued the pros and cons of the lower segment cesarean. Against it, he enumerated the more commonly expressed views—namely, that the lower segment is not well developed before the patient reaches term and technical difficulties will therefore be encountered; the anterior lower segment may in some instances be unusually vascular, owing to superficial vessels and tributaries emerging from the uterine substance, particularly when the placenta is attached anteriorly; the incision may involve the placental site and sutures will tend to tear the tissue, resulting in an imperfect union.

The advocates of this type of operation base their conclusions on the assumption that the spill is better controlled in the lower pelvis, that hemorrhage is diminished, that adhesions are fewer, that there is a stronger scar formation, that convalescence is smoother and the morbidity and mortality lessened.

In America the low cervical cesarean has gradually become dominant in the large maternity centers, but there are those who remain loyal to the classical operation despite repeated pleas (based on convincing statistics by DeLee) to outlaw it. In more recent years, there have been a number of surveys based on cesarean sections performed in certain American institutions, cities, and states. Such were the contributions of Lynch, of San Francisco (1937), Irving, of Boston (1938), Titus, of Pittsburgh (1939), Barrett, of New York (1939), Schumann, of Philadelphia (1939), Matthews and Acken, of Brooklyn (1939), and Cosgrove and Norton, of Jersey City. These surveys all point to the fact that though the classical cesarean is losing ground, it does not lack devotees, and that the low cervical operation is not without its small percentage of deaths due to peritonitis. Falls, of the University of Illinois, was able to find only the slightest balance in favor of the lower segment operation and thought that

it did not merit the extravagant praise of some of its sponsors.

The peritoneal exclusion principle of cesarean section encompasses all types of procedures which exteriorize the delivery space by uniting the parietal and visceral (uterine) peritoneum or by suturing the parietal peritoneum directly onto the uterus.

To briefly embellish the facts with a meager historical background, let me recount the fact that Frank, 15 in 1906, presented his first peritoneal exclusion operation before the International Congress of Medicine at Lisbon, and reported a total of 13 cases the following year, all of which were successful. All these cases had presented complications which rendered the classical incision hazardous; some of these were prolonged labor, early rupture of membranes, repeated vaginal examinations conducted at the home of the patient under adverse conditions, and even an unsuccessful trial of forceps. Frank's innovation was a decisive stop in cesarean section. It is true that A. Kehrer,16 in 1881, had made the first transverse lower segment incision, carefully suturing the cut edges of the musculature and the visceral peritoneum in separate layers, but his work was completely overshadowed by that of Sanger on the simple classical cesarean in 1882 and therefore his innovation was entirely neglected. But his lower segment incision with visceral peritoncal covering has long since been firmly established, replacing the classical approach entirely with many competent obstetri-Many modifications were based on Frank's transperitoneal or peritoneal exclusion principle—some minor and inconsequential, others presenting a distinct variation. Veit17 and his assistant Fromme were among the first to modify Frank's exclusion method. Veit and Fromme applied the Frank principle to a longitudinal incision of the abdominal wall. Both the parietal and uterine peritoneum were sutured to the margins of the abdominal wound. The upper portion of the fundal area was entered by a longitudinal incision. Following the delivery the peritoneal layers were reunited anatomically. This method, with a slightly modified suture of the visceral and parietal peritoneum with removable suture or clamps, was subsequently known as the Veit-Fromme technic (1907). Seldom have there been so many modifications of a surgical procedure as in the years immediately following the original efforts of Fritz Frank.

The peritoneal exclusion operation was introduced in America by B. C. Hirst, <sup>18</sup> in 1913. The union of the parietal peritoneum with the uterus prior to opening that organ received the attention of J. A. Harrar<sup>19</sup> in 1913, J. W. Markoe<sup>20</sup> in 1914, F. C. Holden<sup>21</sup> in 1915, J. O. Polak<sup>22</sup> in

1916, C.S. B. Cassasa<sup>23</sup> in 1916, and T. H. Cherry<sup>21</sup> in 1917. Irving performed 15 operations by this method in 1937. The Veit-Fromme exclusion operation, under its newer name, the Veit-Fromme-Hirst procedure, gained momentum in the twenties for the neglected cases.

Thus the search for a simple exclusion operation has continued unabated in America. But even with the many variations, there are two serious drawbacks associated with any type of exclusion principle: first, the excluded area can hardly be considered truly extraperitoneal from a bacteriologic point of view, because of the numerous needle punctures through the visceral and parietal peritoneum or through the parietal peritoneum and the fundal wall. The advocates of the exclusion principle should cease to think in terms of a "watertight suture line," but instead they must think of a "bacteria-tight compartment." A so-called walling-off suture line is no guarantee against bacterial invasion. Then, too, the traumatized peritoneum is less efficient as a combatant against infectious processes.

The second main drawback rests in the fact that the exclusion operation always presents the possibility that the extraperitonized area may prove inadequate for delivery. Consequently a break in the continuity of the peritoncal suture line may occur during actual delivery-an event which defeats the very purpose of the exclusion principle. Moreover, it is a decidedly unanatomic operation. Its application, then, would seem to be limited to those patients who have been given a trial at labor in whom the possibility of an infection is merely suspected. For the grossly infected patient or mismanaged parturient woman the peritoneal exclusion operation must, with all its modifications, remain a compromise.

Fritz Frank of Cologne began his efforts to circumvent intraperitoneal invasion in 1906. Frank does not definitely state that he actually performed an extraperitoneal operation, but he called attention to the old Physick principle of 1824 as a possible method of approach to the lower segment. It was Hugo Sellheim<sup>1</sup> (1908) who first performed a true extraperitoneal cesarean according to the Physick principle, separating the peritoneal fold from the dome of the bladder and exposing the entire lower segment by displacing the bladder downward. He succeeded in his first three cases. Sellheim was impressed with the migration of the bladder upwards during labor, and particularly during a prolonged labor when the cervix had become totally effaced. But he soon became aware of the surgical difficulties after his first three cases. This was due in part to his lack of an exact knowledge of the fascial

planes. Furthermore, he was not aware of the fact that the relationship between the bladder and the peritoneum was not identical in all cases. His operation consisted of freeing the bladder by blunt dissection on the side and by sharp dissection in the midline. This maneuver exposed the entire lower segment, which was incised longitudinally down to include the entire effaced cervix. In the same year (1908) Latzko,24 impressed with the difficulties encountered in separating the bladder dome from the peritoneal fold, and virtually admitting that the procedure was impossible, devised his own method of extraperitoneal cesarean. His operation differed in that his approach was a lateral paravesical dissection on the left side of the bladder with the bladder and peritoneal fold displaced toward the midline and held in place by a retractor. The procedure exposed the left half of the lower segment, which was incised longitudinally to permit delivery. The success which Latzko achieved by his paravesical exposure of the lower uterine segment led Küstner, Freund, Dührssen, and Solms to seek other extraperitoneal methods of approaching the lower segment.

In 1908, Zwiefel, 25 of Leipsig, brought this new operation to the attention of the English obstetricians at a meeting of the British Medical Association. In 1909 Ballantyne wrote a brief article on this subject. In 1911 Hey-Groves translated Sellheim's article. In the same year Russell described with sufficient detail the leading variations of the extraperitoneal operation. He gave his technic in reporting 6 Latzkotype operations. In 1921 Eardley Holland reported 12 extraperitoneal operations.

With these adequate English translations from the German available, Druskin29 performed the first Latzko operation in New York in 1914. In reporting his first case he made clear the advantages of the operation: lessened bleeding and nonexposure of the abdominal cavity. The intact peritoneum prevented any intra-abdominal leakage of blood or infected amniotic fluid. Since the intestines did not come in contact with the operative field, the incidence of shock was reduced to a minimum. In 1915, James W. Markoen at the New York Lying-In Hospital showed a keen interest in the Latzko cesarean. By September, 1915, Markoe had performed four extraperitoneal cesareans of the Latzko type in infected cases. He reported these cases, reviewed the literature, and carefully analyzed the extraperitoneal cesareans performed in Europe which were now mounting up by the hundreds. After Markoe's death interest in the extraperitoneal cesarean subsided in the New York Lying-In Hospital, one of the leading obstetric centers in America. In 1923 Jellinghaus again reviewed the German literature and revived the interest in the Latzko cesarean at the Lying-In and the New York Nursery and Childs Hospitals. Between 1930 and 1934 Steele and Burns reported 138 extraperitoneal operations performed by members of the staffs of these two institutions. But the Latzko procedure did not gain momentum in America, mainly because it remained a rather difficult operation, and because one of the leading authorities in America had committed himself against it. It must be said, however, that at the Woman's Hospital, since 1938, over 100 extraperitoneal cesareans of the Latzko and Sellheim types have been performed. Recently Cosgrove and Norton reported 209 extraperitoneal operations with a mortality of 1.9 per cent.

Even in Europe the extraperitoneal principle did not meet with unbounded favor. E. Runge<sup>31</sup> (1910) did not believe that the operation offered immunity to an intra-abdominal infection, whether the peritoneum was lacerated or left intact. He was firm in his belief that bacteria could not only penetrate the most accurate suturing, but even the peritoneum itself when it was separated from its underlying tissues. However, this theory remains highly questionable. The development of a peritonitis after an extraperitoneal cesarean leads to the question: Was the operation truly extraperitoneal?

In 1940, the Physick-Sellheim operation was revived in America. Working independently Ricci, 32 of New York, and Waters, 33 of Jersey City. evolved methods which have simplified the separation of the bladder dome from the peritoneal fold. Both investigators have stressed the necessity of a clear understanding of the relationship of the fascial planes to the lower segment. anterior and posterior bladder surfaces, and peritoncal fold. Ricci has been able to modify the Latzko operation without incising the peritoneum in order to expose a greater surface of the lower segment than would otherwise be possible. By exposing the paravesical fossae on both sides. elevating the bladder from its bed throughout, and fraying the fascial structure up to the urachus, it is possible to displace the bladder downward and laterally, rather than merely laterally, and permit a semilunar incision of the lower segment.

A careful review of the literature from 1908 to 1940 reveals that there have been over 3,688 true extraperitoneal operations reported, of which 125 were of the Sellheim type, prior to the Ricci and Waters contributions. The remaining operations were of the Latzko, Döderlein, 4 Küstner, 25 Dührssen-Solms, 25 and Frank types, while in 830 instances the type was not clearly stated.

But, laying aside all argumentation as to the relative value of the different types of extraperitoneal cesareans, the Physick-Sellheim type of operation might well be attempted more often in performing cesarean sections to better acquaint the operator with the anatomy of the fascial attachments.

The extraperitoneal operation is the last haven of safety for a patient with ruptured membranes who has been subjected to repeated vaginal examinations and even futile attempts at vaginal delivery with forceps. It should eliminate from the mind of the obstetrician all thoughts of exteriorization of the uterus, or the Porro operation. And since it prevents peritonitis, it should displace all other types of cesarean for infected or mismanaged cases. It should remove the thought of incising a persistently unyielding cervix by the Dührssen technic, since a wholesome respect for that organ is the sine qua non of sound obstetrics. It is far less traumatic and much safer to deliver by a quickly executed extraperitoneal

cesarean than to subject a patient to craniotomy. But in the final analysis it cannot be gainsaid that no extraperitoneal cesarean, however perfect anatomically and however neatly and rapidly executed, will salvage the parturient who is subject to a blood stream infection. That is a medical, not a surgical problem, and it is becoming increasingly evident that the use of chemotherapy orally or intra-abdominally may even rehabilitate the classical cesarean for all cases. But, for the present, the extraperitoneal approach eliminates the commonest type of fatality following cesarean-a generalized peritonitis.

## DUTCH DOCTORS TO RESIST GERMAN DEPORTATION

The doctor shortage has become so serious in Germany that the Nazi Labor Office in Holland is planning to deport from five hundred to two thousand Dutch physicians to the Reich. Ostensibly their services will be reserved for Netherlands workers in Germany, but actually they will be used to treat German soldiers and civilians.

The Dutch underground newspaper Trouw has seen through this subterfuge, and in a recent issue exhorted the Netherlands doctors to resist deportation as effectively as they resisted German efforts to Nazify the medical profession in the past. "The danger of deportation to Germany is great," the paper pointed out. "We must count on new largescale efforts on the part of the Germans to deport from five hundred to two thousand doctors. ready all doctors have been ordered to register at

the Labor Office.
"The watchword must be 'No Dutch doctor goes voluntarily to Germany.' "

Trouw stated the following reasons why doctors should resist deportation: "It is most improbable that the Germans would allow them to treat Dutch workers-Netherlands medical students in Germany are often employed as doctors, but never in Dutch labor camps. If they go to Germany for the benefit of the German workers, they will be rendering an important service to the enemy. Once deportation of doctors begins, it will not be stopped—there would be a calamitous shortage of doctors in Holland."

Anton Mussert, head of the Dutch Nazi party, had indicated at the annual meeting of the Nazified "Medical Front" that the Germans were planning to conscript five hundred to one thousand Netherlands physicians, and asserted, "We will do our utmost to force these immoral, unpatriotic doctors, who want to leave their compatriots in Germany without medical care, to do their duty."—Release from the Netherlands Information Bureau

## Therapeutics

## CONFERENCES ON THERAPY

THESE are stenographic reports, slightly edited, of conferences by the members of the Departments of Pharmacology and of Medicine of Cornell University Medical College and the New York Hospital, with collaboration of other departments and institutions. The questions and discussions involve participation by members of the staff of the college and hospital, students, and visitors. The next report will appear in the July 1 issue and will concern "Management of Di-orders of the Thyroid: II. Myxedema."

## Management of Disorders of the Thyroid: I. Hyperthyroidism

Dr. Harry Gold: The conference this morning is on the subject of Graves' disease. It is proposed that we take up both the medical and the surgical aspects. The two phases of treatment are closely related in any plan of therapy for patients with this disease. Dr. Shorr will open the discussion of the medical treatment of Graves' disease

Dr. Ephram Shorn: Since Dr. Glenn will present the details of preoperative treatment of Graves' disease, I shall confine my discussion to the general principles underlying the therapy of this condition. Since therapy can be only as good as our understanding of the mechanism of any disease, we may appropriately consider first what we know of this symptom complex and see how this knowledge provides a basis for therapeusis.

First, the constitutional aspects. For a long time, it has been generally recognized that certain constitutional types are prone to develop Graves' disease. By far the largest number of patients fall into the linear type, the so-called lymphatic constitution whose characteristics have been so ably described by Warthin. This is, of course, not to say that the disease is confined to this group, since every constitutional type contributes to its numbers. This group manifests a great deal of autonomic instability and contributes not only to the Graves' disease population, but to the peptic ulcer group, and to the group of patients presenting a great deal of autonomic instability without, however, frank Graves' disease. Since there is nothing we can do about altering constitution, this knowledge of a constitutional predisposition is chiefly of diagnostic

The second predisposing factor is to be found in those critical phenomena which influence the stability of the thyroid apparatus. These critical episodes are much more prominent in women; hence women make up the preponderating number of patients with Graves' disease. At puberty, at the menopause, and during pregnancy, the thyroid apparatus is much less stable than at other

periods. This instability is manifested by the higher incidence of goiter at these times. Infections, menstruation, and indeed any form of stress are also prone to render the thyroid mechanism less stable. At these times, the thyroid apparatus undergoes hypertrophy and hyperplasia unless additional iodine is given above that which is present in food; and, of course, in the goiter belts where the iodine content of the environment is low, these phenomena are exagger-Once the instability of the thyroid apparatus has developed, it is more likely to be further upset by any additional type of strain. Therefore we are likely to see the organism thrown into Graves' disease when a strain is coincidental with this physiologic stress. The higher frequency of physiologic stresses in women is now generally recognized as responsible for the higher incidence of Graves' disease, but it should be emphasized that it is not the menopause or pregnancy, for example, which is the cause of Graves' disease: rather it is that such conditions render the gland more vulnerable. Therapeutic implications are preventive in nature. Women at these periods of physiologic stress should be protected by the administration of adequate amounts of iodine.

We have thus considered two factors-constitutional makeup and the influence of periods of physiologic stress. We now have to inquire into those processes by which this soil is inseminated. Many of us believe that the most important influences are psychologic and emotional and that these influences may be divided into the chronic and the acute. While an acute emotional experience appears capable of inducing Graves' disease in a suitable soil if it is intense enough, it is much more usual to find it superimposed on long-standing chronic anxiety and insecurity. Careful psychiatric histories show, with few exceptions, this chronic type of behavior which culminates in some acute episode of such a nature as to reinforce the feeling of insecurity. The therapeutic implications are obvious but not easy of fulfillment, since these patients seek advice

after the disease is well developed. There appears to be no ready mechanism by which their emotional and psychologic setup can be influenced so as to minimize the impact of a psychic trauma. What one can hope to do is to influence the severity of the reaction and to diminish the possibility of recurrence. There may be some difference of opinion as to how intensive psychotherapy should be during the active stage of the disease while the patient is being prepared for operation. Is one likely to cause an exacerbation of symptoms and worsen the condition? My own feeling is that patients, during the active state of Graves' disease, are much more accessible psychologically than they are likely to be after operation, and for that reason one can acquire a great deal of psychologic material which one can then utilize after operation. Furthermore, it is often very beneficial to bring out into the light the specific problems which are bothering the patient, and which she has succeeded in repressing, to her disadvantage, Although one runs the risk of a temporary exacerbation, these flare-ups are usually followed by considerable relief of emotional tension with distinct benefit to the patient's progress. With respect to postoperative psychotherapy, there would appear to be no disagreement as to its value. Indeed, it is a necessity if many patients are to be protected from a recurrence of their illness.

Adjuvant measures are the use of sedatives and physiotherapy. However, sedatives may be abused. If, for example, 30 mg. of phenobarbital four times a day do not succeed in quieting a patient, raising the dose is usually ineffective and not infrequently leads to toxic reactions such as are commonly seen in psychotic patients who have been oversedated. We have occasionally encountered hyperthermias and even toxic delirium from oversedation. What is of help is adjuvant physiotherapy in the form of tepid tubs, morning and night, for one-half hour at temperatures of 98-100 F. In addition, attention should be paid to the environment under which the patient is likely to feel the most at ease. Isolation in a darkened room with complete inactivity is not infrequently a very unhappy state for some patients who much prefer a companion with whom they may chat, or even the social character of a four-bed ward, and who will be rested rather than disturbed by a radio. Individualization of each patient in respect to environment is of considerable importance.

We may now consider the metabolic disturbances which threaten the organic security of a patient with Graves' disease. Virtually every metabolic process is disturbed in every case of Graves' disease of any severity. The increase in total metabolism must be met by providing a

sufficient number of calories. As for patients with Graves' disease who are confined to bed, it is almost impossible to keep them on caloric equilibrium with less than double their basal number of calories, but, in addition to calories, there are specific recommendations which can be made on the basis of the metabolic defects characteristic of the disease. There is usually an abnormally high nitrogen metabolism, but one should not aim to meet the increased need for nitrogen by supplying an excessive protein intake, which would have the disadvantage of increasing specific dynamic energy and, hence, caloric waste. It is now well established that protein metabolism can be reduced to normal levels by supplying sufficient calories in the form of carbohydrate and fat, which are without this disadvantage. Disturbances in carbohydrate metabolism are evidenced by the delayed sugar curves comparable to those in diabetes, and the not infrequent glycosuria. The carbohydrate defects in Graves' disease do not, however, arise from any defect in oxidation; in fact, oxidation of carbohydrate usually proceeds at even higher than normal rates. The derangement is entirely a matter of storage difficulties. Possibly because of the increased sensitivity of the liver to epinephrine, there is a greater tendency to glycogenolysis than in the normal. Nevertheless, adequate storage will go on if sufficiently large amounts of earbohydrate are given.

There is an abnormally high loss of calcium and phosphorus from the body. Occasionally this may lead to extensive rarefaction of the bones and should be dealt with by a high calcium intake. A quart of milk a day will generally suffice to put such patients on positive calcium balance. Vitamin requirements are also much greater and vitamin supplements should be a regular part of any dietetic regimen.

There is one other metabolic abnormality characteristic of Graves' disease which is probably of considerable significance for the organism-namely, the disturbance in creatine metabolism. This is manifested by an abnormal creatinuria, a poor creatine tolerance, and a reduction in the rate of creatinine excretion, similar to that seen in progressive muscular dystrophy. If this disturbance is allowed to continue uncorrected, it will result in muscle destruction. It is felt that the destructive changes in the extra-ocular muscles in Graves' disease are a result of this disturbance in creatine metabolism. It is impossible to correct this metabolic defect by diet; however, iodine specifically abolishes it.

This brings us to the question of specific therapy. Up to the introduction of radioactive iodine and thiouracil, iodine has been our chief reliance. Doses required are relatively small; certainly not more than 15 mg. of iodine a day ever appear to be necessary. The conception that when such amounts of iodine failed to reduce the basal metabolic rate, larger doses would, does not accord with our experience. We feel that iodine should be administered once the diagnosis of Graves' disease is made because of the existence of these precarious metabolic disturbances which iodine specifically corrects.

This leads up to the consideration of the decision as to which regimen-medical or surgicalshould be employed in any given case. There is no real difference of opinion as to the choice in most cases of Graves' disease. At present the most effective means of controlling the disease in the majority of cases is by subtotal thyroidec-

Operation interposes a block in the cycle of events by reducing profoundly the extent of thyroid activity; and despite our recognition that it is a far from perfect method and does not go to the heart of the problem, it is a pragmatic procedure which is the most likely of any now known to check the disease in a high percentage of cuses.

There is, however, a small percentage of patients, probably 5 or 10 per cent, who respond extremely well to a conservative regimen, and I should like to suggest some criteria by which one may decide whether operation or a more conservative regimen should be employed. If the patient is in the older age group where the continuation of the disease endangers the cardiovascular system, conservative therapy is not indicated. the patient is in the period of puberty or menopause, some consideration should be given to the possibility of nonoperative stabilization. If the illness is very severe and of long duration, conservative therapy is not warranted. If the gland is large, conservative therapy is rarely successful. If the response to iodine, both as regards the immediate and prolonged course, is excellent, conservative management is favored. If there is a psychologic problem which can be well defined in a patient with enough insight to deal with it, and if the social and economic conditions look lavorable, a conservative regimen may be considered. By weighing all of these factors, it is not very hard to make a decision as to which regimen should be followed.

It may very well be that the recent advances in the treatment of Graves' disease, such as the use of thiouracil and radioactive iodine, will greatly increase the number of those who can be treated nonsurgically.

There may be an opportunity later in the conference to touch on these new approaches.

This has been a very brief consideration of a very complex problem.

Dr. Gold: Dr. Shorr's presentation is now open for discussion.

STUDENT: I should like to ask Dr. Shorr whether the more severe state of the disease is a contraindication to surgery?

Dr. Shorn: No. It is the other way.

STUDENT: I thought it was a contraindication.

Dr. Gold: Apparently, Dr. Shorr does not. I think we would all agree that the operative mortality is higher, the more severe the disease, and that in such cases it is imperative to secure remission by medical treatment before operation.

DR. WALTER MODELL: I wonder if Dr. Shorr would discuss further the matter of constitution as a causative factor, especially the endocrine constitution.

Dr. Gold: Is that question clear?

Dr. Shorn: The question is clear enough but the concept of constitution is not. All that one can say about it is that we see rather specific constitutional types among patients with Graves' Their resemblance to one another is analogous to the sort of thing we see in gastrointestinal diseases—namely, the ulcer type, the gallbladder type, and, if we were to go further, the pernicious anemia type. I was looking over a group of cases recently and noticed with what frequency Graves' disease and ulcer go together. The term "lymphatic type" also applies to them: there is marked growth of lymphatic tissue not only in the lymphatic tissues all over the body but there is invasion of the thyroid by masses of lymphatic tissue so extreme as to resemble a tonsil. I am sure that Dr. Foote can show you case after case of that kind. The familial factor is, of course, well recognized. We have families in which practically all of the women have had Graves' disease. In that group the incidence of recurrence is high. This is a very sketchy picture but it is all I know which can be said with any certainty.

STUDENT: Is the calcium imbalance an invariable accompaniment of Graves' disease?

DR. SHORR: Yes.

STUDENT: I should think that might be of some importance in relation to cardiac and gastrointestinal function, and to the possibility of formation of renal stones. Is it considered very important from these standpoints? Has it also to do with the parathyroid hyperplasia?

Dr. Shorr: The nature of calcium deficiency in Graves' disease is not clearly understood. As it is generally encountered, the chief disturbance results from decalcification, particularly in the spine. Not infrequently the patient complains bitterly of that particular manifestation. We do not usually explore that defect sufficiently.

STUDENT: The term "masked hyperthyroidism" is widely used. What does it mean?

Dr. Shorn: I think it refers to the many cases which do not correspond to the textbook picture of the disease. There is a tendency to regard the textbook picture as the rule; Graves' disease is masked or unmasked in so far as it contains few or all of the classical features. The so-called masked variety puts more of a strain on the ingenuity, clinical acuity, and all the specific diagnostic tests.

Dr. Gold: Do we not usually place a great deal of emphasis on the nervous symptoms in the diagnosis of Graves' disease? Doesn't the term "masked hyperthyroidism" refer usually to those cases in which the nervous symptoms are minimal; for example, cases with predominantly gastrointestinal symptoms, or those with few or no nervous symptoms but with recurring attacks of heart failure or rhythm disorders?

Dr. Shorn: The attitude that exophthalmos must be present invariably in Graves' disease has, of course, been invalidated. In any large clinic you see many cases of perfectly straightforward and severe Graves' disease without exophthalmos.

DR. McKeen Cattell: It seems pretty clear from what has been said that psychic factors play an important part in Graves' disease, as well as certain structural and functional changes. Is there any relation between these? Which comes first?

Dr. Shorn: I wish I knew. We do not know the way in which those transfers are made. Perhaps the organism should be regarded as a whole with disturbances occurring on more than one level. There may be one common cause for all of them. Animal experimentation suggests that the pituitary may be a common pathway by which emotion may make itself felt in functions. For example, below the level of consciousness an emotional disturbance will produce an amenorrhea, since the pituitary is the source of the gonadotropic stimulation. I cannot prove it and no one has established it with any degree of certainty.

DR. CATTELL: In Graves' disease the pathway would then be through the thyrotropic hormone of the pituitary?

DR. SHORR: So we assume from our observations on animals. So far, examinations of the pituitary in humans have not revealed any gross pathology. However, the work of Rawson and his associates has clearly shown that during active Graves' disease there is an excess of thyroid-stimulating hormone in the urine. The hormone is largely in an inactive form and must be activated by autoclaving. When this is done, there is usually found to be twice the normal amount of thyrotropic hormonal activity present. This interesting observation of Rawson has important implications. It would indicate that the thyro-

tropic hormone undergoes inactivation in the process of hyperplasia. This same principle probably holds for the gonadotropic hormone also.

Dr. Gold: Dr. Shorr, have you ever cured a case of Graves' disease by the psychologic approach alone, or is such an approach productive only as an adjuvant in pre- and postoperative treatment?

Dr. Shorn: One should ask whether cases are cured by any specific means of treatment, whether it be surgery or medicine. Patients become well under both regimens. The exact process I think we have to leave unsettled.

Dr. Gold: Suppose we put a modified question in the form of numbers. Would you say that one out of ten, or one out of twenty, of the garden variety of cases of Graves' diseases which have come to your attention will get by without having the thyroid removed?

Dr. Shorn: One out of ten.

Dr. Gold: I should have said that it is less than that.

Dr. Shorn: We always apply conservative treatment first in cases with recurrence before subjecting them to a second thyroidectomy. The problems there are similar to those existing before any operation in these cases.

Dr. Cattell: Since the psychiatric factors seem so important etiologically, would you suggest that all patients with Graves' disease receive some psychotherapy, at least postoperatively?

Dr. Shorn: I feel very strongly that it is one of our major therapeutic weapons and that a certain amount of psychotherapy, certainly psychiatric investigation, should be carried on before operation with a view to providing the physician with clues to psychotherapy after operation, at which time it should be universally employed.

Very often patients will quiet down so much after operation that they become quite inaccessible to psychiatric exploration, certainly much less so than when they are very hyperkinetic, talk a good deal, and are prone to give verbal expressions to their problems. Because of this, I always find out as much as I can about the patient during the active stage of Graves' disease in order to store up information which would facilitate psychotherapy afterward.

Dr. Gold: Dr. Glenn has been detained at an operation. He has supplied a manuscript on surgical aspects which Dr. Travell will read.

DR. FRANK GLENN: My remarks are confined to one phase of therapy, the pre- and postoperative management of the patient with hyperthyroidism.

Preoperative Management.—To control the psychic factors, the patient, upon admission to the hospital, is placed in a quiet single room from which noise and confusion are eliminated as much

as possible. Every member of the surgical and nursing staff attending him should contribute in some measure to his peace of mind and feeling of security. The psychic aspect of hyperthyroidism is of great importance and should seriously be considered in the treatment of the condition. Visits from friends are discouraged, and nervousness and restlessness are controlled by sedatives. The room is darkened for regular periods of rest. The diet is planned so as to produce a gain in weight and an increase in reserve strength; the patient's preferences in food are studied by the dietitian, who arranges the trays and checks the amount actually consumed. Careful attention is given to complaints of service or accommodation, so that the patient feels that his well-being is important to all members of the staff.

The surgeon who will operate and his assistants cultivate a friendly relationship with the patient and, by allowing him to voice his fears and wornes, acquire his confidence. As soon as he has gained some self-control, the preoperative and operative treatment, as necessary steps in restoring him to health, are presented to him, and his cooperation is sought.

Physical Preparation.—The physical preparation of the patient must be carried out with proper observance of the principles just enumerated. The routine examinations on admission to the hospital are planned with regard for the patient's state of mind and are not allowed to interfere with regular periods of rest. The chest and the cervical region are examined to ascertain the presence of substernal or retrotracheal extensions of the thyroid gland. The basal metabolic rate is determined soon after admission and once a week thereafter. The weight is recorded twice a week. Medication for the thyroid patient is confined to mild sedatives, iodine, cathartics, and digitalis when indicated. Sodium amytal is our usual sedative, the average dose being 0.1 Gm. three times a day. Phenobarbital or bromides may be substituted for amytal. A nice adjustment of the dosage is essential to avoid periods of confusion, which result from too large amounts of the sedative drug. Iodine is administered in the form of Lugol's solution in doses of 0.6 cc. three times a day. If symptoms of iodism appear, the dose is reduced.

Digitalis is not prescribed routinely but is reserved for patients with auricular fibrillation or decompensation. The toxic thyroid patient usually requires larger doses of digitalis for a therapeutic effect than is ordinarily necessary, but as the hyperthyroidism recedes during the preoperative therapy, the dosage usually can be reduced.

Optimum Time for Operation.—The progress of the patient toward a condition in which it will be safe to operate is recorded day by day. A number

of factors enable the experienced surgeon to judge this progress in the individual case. No one sign is reliable except in conjunction with others. The patient should show marked regression of the outward signs of hyperthyroidism, evident in the disappearance of the anxious facial expression and diminution of the tense restlessness. The pulse should have dropped to normal or be approaching normal and excessive perspiration should have ceased. A gain in weight more than sufficient to compensate for losses suffered during the disease should be recorded. This is often not steadily progressive. If it is, the most favorable time for operation is during a phase of increasing weight. The thyroid gland should be smaller and firmer than on admission. However, if the patient has been taking iodine prior to admission, this will not be evident. A fall in the basal metabolism is looked upon as evidence that the progress generally has been satisfactory, but it alone cannot be relied upon to indicate the optimal time for operation.

There is considerable difference of opinion concerning the wisdom of extending the preoperative therapy over a long period of time. It has been found that many patients improve very little and may lose some of the benefit of the preparation for operation after from sixteen to eighteen days. The usual preoperative period at the New York Hospital is twelve to sixteen days. It is in determining the time for operation that there is great need of experience and judgment. Hyperthyroidism in each individual case is a unique disease in that no two patients react in exactly the same manner to outside influences, therapy, and operation. This necessitates a careful evaluation of all available signs in each patient.

Postoperative Management.—The immediate postoperative therapy begins with the application of the dressing at the conclusion of the operation. In order to be comfortable and yet give the patient support for the operative wound, it must be soft and secure and not easily displaced or soiled.

The patient is transferred from the operating table to his bed and taken to the ward in it, so that he need be lifted only once. If he is awake, a word of reassurance about the success of the operation will allay his fears and, when he recognizes the personnel and surroundings with which he became familiar before operation, he realizes that he has no cause to worry. A hypodermic of morphine, 0.01 Gm., is given immediately and Lugol's solution, 1.6 cc. in 100 cc. of water, is given by rectum. Special nurses are in attendance for the first twenty-four hours, during which period the pulse is recorded frequently. Fluids by mouth are withheld until there is reason to believe that they will be retained and swallowed without too much pain. After that, the patient is urged to drink all he can, chiefly fruit juices for their glucose content. If, in the first twelve hours, the fluid intake has not been sufficient, fluids are given intravenously or subcutaneously. Intravenous glucose is of considerable value in the immediate postoperative therapy of toxic patients.

Convalescent Period.—The wound is inspected at the end of twenty-four hours and every other skin suture is cut. The following day the cut sutures are removed and the remaining sutures cut. In the routine case other sedatives are substituted for morphine after two or three days and these are gradually reduced in amount over a period of five or six days. As soon as all nausea has ceased and liquids are well taken, Lugol's solution is given orally, in the preoperative dosage. After five or six days, the dose is cut in half and then gradually reduced so that, at the end of the hospital stay, the patient is accustomed to being without iodine.

The patient is allowed to sit up in bed on the seventh or eighth day and is discharged after a final basal metabolism reading on the tenth or eleventh day after operation.

During the period of convalescence from operation, the psychic factors are borne in mind as before operation. The room is kept quiet. Visits, even from the members of the staff, are restricted and the patient is surrounded by a cheerful atmosphere. Comments on his condition in his presence should always be favorable, and discussions of problems which arise should not occur in his hearing.

Postoperative Complications.—The postoperative management is not always as simple and uneventful as outlined, for situations may arise which greatly complicate convalescence. These include postoperative nausea and vomiting, thyroid crisis, postoperative hemorrhage, tracheal collapse, edema of the larynx, stridor, tracheitis, and pulmonary complications. I shall comment on the most important of these.

Thyroid Crisis: This is, perhaps, the most serious complication after thyroidectomy. In patients who have been prepared for operation with iodine and other therapeutic measures it is not a frequent occurrence. It begins within the first twenty-four hours after operation and is characterized by increasing tachycardia accompanied by intense restlessness which may proceed to extreme agitation and delirium. The skin is flushed and perspiration profuse. The temperature rises quite rapidly to 104 or 106 F. Nausea and vomiting may be present. These critical signs may at any time recede or they may lead to collapse and death.

The increased nervousness and agitation are best combated by frequent small doses of morphine. The rapid pulse and cardiac irregularity may be benefited by oxygen therapy. Rapid digitalization should be instituted. The intravenous or subcutaneous administration of glucose in saline is of great benefit. Fifty per cent glucose solution given very slowly into the vein or a continuous intravenous drip of 5 to 10 per cent glucose provides the large amounts of fluid required by the patient during a postoperative crisis. The value of iodine in postoperative exacerbations of hyperthyroidism is open to question.

Cardiac Complications: The cardiac complications of thyroidectomy depend partially upon the adequacy of the preoperative preparation. A patient with little cardiac reserve before operation should be digitalized. This may prevent a cardiac break during convalescence.

Nausea and Vomiting: Numerous procedures have been evolved to reduce the nausea and vomiting which so commonly accompany an operation. In thyroid patients vomiting is particularly undesirable, as it puts a strain on the wound and is associated with considerable pain and discomfort. Restricting fluids by mouth immediately before operation and limiting them to frequent small amounts after operation and keeping the room well ventilated and quiet are simple, obvious measures which we employ. Morphine sometimes causes nausea and vomiting, and in cases where it does, other sedative drugs are substituted and overdosage is carefully The nausea and vomiting following avoided. general anesthesia often can be minimized by hyperventilation through the administration of oxygen and carbon dioxide. If vomiting once starts, it is difficult to stop; wherefore efforts to prevent it are well spent.

DR. CATTELL: I should like to ask Dr. Shorr if he will state the regimen he uses in the administration of iodine, as well as the criteria for its usc.

Dr. Shorn: Any form of iodine is effective. It may be breathed in, rubbed into the skin, or taken as Lugol's solution or syrup of hydriodic acid. About that there seems to be no difference of opinion. The actual amount required is small. I should say that there is very good evidence that anywhere from 9 to 15 mg. a day are all that are required in Graves' disease. The larger amounts, as far as I know, do not give any trouble except when iodism occurs. I stress the small requirement of iodine lest we think that larger amounts are necessary when the patient does not appear to respond well. The larger doses, to my knowledge, do not hurt, but the error lies in failing to consider that other factors may account for the unsatisfactory response.

With regard to the preoperative preparation, I am sure that Dr. Glenn shares with me the belief that this should not be routinized and he has laid

down the criteria by which the experienced surgeon recognizes that beneficial effects have occurred, and that the time is ripe for operation. We very frequently carry patients on much longer. The duration of the preoperative treatment depends, in our opinion, on the severity of the illness, its duration, and the presence of complications, particularly cardiac, which should be corrected as far as possible before operation.

The rationale of iodine is twofold: first of all to reverse, or rather to arrest, the pathologic processes, and, second, to allow the building up of reserves. The maximum benefit is achieved, therefore, when both objectives are reached.

Dr. Cattell: Is iodine continued indefinitely if the patient is not subjected to operation?

Dr. Shorn: Iodine may be given indefinitely to the properly selected patient. Indeed, it is our practice to give iodine postoperatively for a year in every instance. Our reason for that is the belief that the operation does not eliminate the basic cause of the disease and for that reason the patient should be protected while the more general factors leading to the disease are being cor-Another rather specific indication is based on the observation that the residual thyroid remains hyperplastic for a long time. If satisfactory involution does not take place, the gland may atrophy with resulting myxedema. Iodine promotes involution of the hyperplastic tissue. Finally, stabilization of the disease may take as long as three or four years after operation. Iodine promotes stabilization, a fact which is especially in evidence in those with signs of recurrence. I think we are inclined to expect too much of iodine. It cannot take the place of attention to the emotional factors which excite the disease. Relapse during iodine administration is likely to be due to a failure to maintain appropriate management of the emotional situation, rather than to the fact that iodine given for long periods of time fails to maintain its reparative action. That is how it comes about that we observe the immediate effects of iodine, which are not too well understood, and then the emotional factors return to increase again the basal metabolic rate. When these emotional factors have been attended to, we commonly see the metabolic rate decline again. It is a challenge to us when a patient does not maintain a satisfactory postoperative state during iodine therapy.

Dr. Gold: In relation to the dosage of iodine for the preoperative remission, is the remission likely to take place more quickly with large doses than with small ones?

Dr. Shorn: Means carried out a series of studies with Thompson in Boston, using rather large doses of iodine. Thompson returned to Chicago and studied a similar series, using only 9 mg, of iodine. The curves were practically iden-

Dr. Wheeler: What, in terms of syrup of hydriodic acid, is that?

Dr. Shorn: One cc. of syrup of hydriodic acid contains about 13 mg.; one minim of Lugol's about 9 mg. of iodine. In other words, a minim of Lugol's is all that is required for the iodine effect of Graves' disease.

Dr. Gold: The dose of 15 mg. is regarded as a small dose of iodine, but even this is a lot of iodine in comparison to the amount in the body. It is as much as there is in the entire thyroid gland. The daily intake of iodine is about 0.2 mg. and the daily requirement is only 0.02 mg. under ordinary conditions. A cc. of Lugol's solution contains about 125 mg. of iodine.

Dr. Shorr: Indeed, studies with radioactive materials have shown that the doses of iodine which we consider small are really very much larger than the requirements of the body in active Graves' disease.

Dr. McLean: Do you employ conservative treatment in Graves' patients with exophthalmos?

Dr. Shorn: Not as a rule. Fairly prompt operation is advisable in order to avoid further impairment of the eyes. The patient who has been treated with iodine continues to have a lowgrade Graves' disease for a month or two before complete remission. One does not like to risk further damage to an already threatened ocular apparatus. Of course, there is the fact that thyroidectomy sometimes increases the exophthalmos.

Dr. McLean: I should like to ask what can be done with nonsurgical means for a patient who develops progressive postoperative exophthalmos?

Dr. Shorn:' The present status of this problem is extremely discouraging because I think we understand it poorly. A variety of explanations have been suggested for this distressing phenomenon. Some of these regard malignant exophthalmos as if it were a purely postoperative phenomenon. We know a little more about the development of exophthalmos in experimental animals under the influence of thyrotropic hor-The well-developed orbital muscles of many lower animals provide a reasonable explanation for the proptotic mechanism. In the human, however, there is considerable difference of opinion as to the possible role of Müller's smooth muscle in this phenomenon. We also know that exophthalmos is induced by thyrotropic hormone in animals, with greater uniformity in the absence of the thyroid, suggesting that thyrotropic hormone itself may be responsible for its development by some yet unknown

train of events. Exophthalmos is frequently very marked in patients with Graves' disease with low metabolic rates, so that it is far greater in degree than the hypermetabolism would appear to warrant. Certain pathologic changes are noted, of particular interest being the degenerated swollen extra-ocular muscles. My inclination is to regard these pathologic muscle changes as of primary importance in the development of exophthalmos. I am also inclined to regard the action of Müller's muscle as participating, since it is smooth muscle and is, unlike skeletal muscle, undamaged in Graves' disease. The changes in the extra-ocular muscles I have been prone to interpret as secondary to the well-recognized defects in muscle metabolism characteristic of Graves' disease. These patients, no matter what the basal rate, have defects in creatine metabolism, as is evidenced by abnormal creatinuria, poor creatine tolerance, and a reduction in the total creatinine. which is our best index of muscle function. These defects apparently remain functional for varying lengths of time, but if uncorrected they lead to actual muscle degeneration similar to that seen in progressive muscular dystrophy. Such degeneration might be anticipated to be most marked in muscles that are being constantly used; in this group fall the extra-ocular muscles which are under constant tension, undergoing rapid movement continuously.

Just how these extra-ocular muscular defects might lead to exophthalmos is a matter of speculation. If there is a great deal of edema, as is very frequently the case, and the muscles lose their strength and elongate, the eye might move forward and the orbit acquire edema fluid or fat, to make this state irreversible. Even a slight influence of the unharmed smooth muscle of Muller would contribute to the exophthalmos. A third factor may be degenerative changes in the orbicularis oculi which, being a striated muscle, might also be damaged. I realize that this does not provide an explanation for the sudden exacerbation of exophthalmos which is occasionally seen after operation, except for the possibility that the eye muscle damage may be at a very advanced stage at the time of operation and the final touches may be added to by the acute reduction in circulating thyroid hormone which usually follows subtotal thyroidectomy. ever the final explanation, I am persuaded to regard the creatine defect as of great significance. On this basis, then, the two therapeutic agents which might be of help in relieving this condition are iodine during the preoperative phase and thyroid hormone thereafter.

DR. McLean: How successful do you find

Dr. Shorn: I do not think that my experience

is large enough to permit me to give you anything but impressions. In many cases, the extra-ocular muscle changes are undoubtedly so far advanced that nothing is likely to help them. In other cases, some regression is observed which may be due to the fact that the changes in the muscle are still functional and reversible. It is a rather general impression that desiccated thyroid is of some benefit, particularly in halting the progress of this condition.

Dr. McLean: My own impression is that the outlook is not very cheerful.

Dr. Gold: How about some of the newer measures in the treatment of Graves' disease?

Dr. Shorn: At least two modern developments in the treatment of Graves' disease have proved extremely promising. One is the use of radioactive iodine and the other of a new chemotherapeutic agent, thiouracil.

The first is a logical development of the use of x-ray in Graves' disease, a procedure whose therapeutic effects were occasionally successful, but all too frequently unreliable. The development of radioactive isotopes of iodine seemed likely to provide a much more effective method of carrying measured amounts of radioactivity to a hyperplastic gland. After a good deal of experimental work on animals by means of radioactive isotopes which had been developed during recent years, experimental studies in humans were carried out by Hertz, Roberts, Means, and Evans in Boston, and by Hamilton and Soley of the Radiation Laboratory at Berkeley, California. The former used radioactive iodine with a half life of twenty-five minutes; the latter, an iodine with a half life of eight days. Both of these radioactive iodines were found to enter the thyroid gland just as did normal iodine, and to be able to carry a definite amount of radioactivity to it. These studies have included relatively few patients and were interrupted by the war, but the results so far, in the hands of both investigators, were extremely promising. We can anticipate, therefore, that the further pursuit of this aspect of therapy may reveal it as a very effective means of dealing in nonsurgical fashion with many cases of Graves' disease.

The second agent, thiouracil, has been under study for about a year and one-half now in a number of laboratories. This therapeutic agent owes its development to the original observations of the McKenzies and McCollum that the sulfon-amides produced thyroid hyperplasia and insufficiency in experimental animals. Further exploration of large numbers of related compounds showed that thio-urea, and particularly thiouracil, produced thyroid hyperplasia and insufficiency in animals. The mechanism of its action has been elucidated largely by Astwood, who showed that

thiouracil inhibited the formation of thyroid hormone in the gland by some type of enzymatic block. As a result, once the pre-existing store of hormone was used up, the state of thyroid insufficiency developed; the anterior pituitary was stimulated to produce more thyrotropic hormone, which then caused an ineffectual thyroid hyperplasia. It was first applied to the treatment of Graves' disease by Astwood and since then has been an active subject of research.

Its effects in the human are similar to those in the animal. With proper dosages, there occurs a reduction in basal metabolic rate and a corresponding improvement in symptomatology. If high doses are continued for long enough, changes comparable to myxedema are induced with a hypercholesterinemia. Our own studies have shown that this diminution in basal rate induced by thiouracil is accompanied by a correction o' the metabolic derangements in calcium, phosphorus, nitrogen, and creatine metabolism which are characteristic of Graves' disease; hence this drug would appear to act in a physiologic manner. The usual therapeutic dose is from 0.6-0.8 Gm. per day, in divided doses, and the customary maintenance dose is 0.1-0.2 Gm. per day The maintenance dose is instituted once the basal metabolic rate has been restored to normal.

A few toxic results have been encountered following the use of this drug, usually during the first two or three weeks of administration. Several cases of agranulocytosis, several skin eruptions, one benign icterus, and several instances of hyperthermia have been reported. These, fortunately, have disappeared upon discontinuation of administration of the drug.

What the eventual fate of patients treated with this drug will be, it is too early to state. Astwood, in a personal communication, stated that two cases of this series have continued to hold their gains after discontinuation of therapy. My own opinion is that the future course of a patient treated with thiouracil could depend upon a number of factors: Those on a profound psychoneurotic basis which would not seem likely to be corrected, either because of reality situations or because of the rigidity of the individual, might be expected to require constant medication. Those in whom the emotional difficulties are less profound, and which originate in factors that are correctible, may very well be able to remain free of symptoms on discontinuation of therapy, providing the emotional aspects of their disease have been properly managed. I suspect that patients with large goiters will eventually come to operation, since they are prone to wide fluctuations in thyroid activity, under even slight stress; and it has been our experience that these patients require maintenance doses of as much as 0.3 Gm. per day.

These impressions persuade me to emphasize again the fundamental importance of the psychotherapeutic approach to Graves' disease. Whatever the percentage of cases which may be suitable for conservative treatment with thiouracil alone, it is undoubtedly going to assume a most important role as a substitute for iodine in the preparation of patients for thyroidectomy. The hyperplastic gland induced by thiouracil, while vascular, is not friable and is readily handled at operation. The remission of symptoms is much more uniform and stable than is produced by iodine and it would not surprise me if it should replace iodine as the orthodox preoperative procedure. We may also expect that further investigations may reveal a drug with a similar action but with fewer toxic side-effects.

STUDENT: I was under the impression, from an article on thiouracil, that in patients with normal basal metabolic rate thiouracil has no effect on the metabolism. I was just wondering what caused myxedema in one of your patients?

Dr. Shorm: I have not done any work on the normal human but we have every reason to expect, from studies on the normal animal, that if the therapy were prolonged, the reduction in basal rate would be eventually obtained.

STUDENT: Is the normal animal less sensitive to thiouracil?

Dr. Shorn: Actually, the largest amount of experimentation has been done on the normal animal. We may regard the temporary resistance of the normal patient as due to the fact that it takes him a long time to use up the stored thyroid hormone and that the experiments carried out so far have not been long enough for the subjects to have used up these stores.

DR. GOLD: Do you put all patients with Graves' disease to bed during treatment here in the hospital?

Dr. Shorn: There is no uniform regimen. On our Service we put them to bed initially and during the early stages of iodine therapy. Then we allow them up for increasing periods of each day, so that by the time they are ready for operation they are ambulatory. We feel that when ambulatory and comfortable the patient is in excellent shape for thyroidectomy. Most of our patients treated with thiouracil are ambulatory except during the initial stages, when their basal metabolic rate is high.

Dr. Charles H. Wheeler: A few years ago it was customary on the medical service not to transfer a patient to surgery until the metabolism was stabilized at a fairly low level—not normal, by any means, but stabilized—the pulse was slow, gain of weight had started, and the patient looked and felt well. It was my impression over a period of four or five years here in the hospital that it

was rare for a patient who fulfilled these criteria to have any difficulties after the operation. Recently I saw several patients in whom these criteria were not fulfilled; they had reactions after operation. In talking the matter over with the surgeons I gather that they have a much less conservative viewpoint. They are prone to treat the patient medically for ten days or two weeks. They consider that enough, and go ahead and operate whether or not these criteria were fulfilled. I am wondering—is our viewpoint too conservative?

Dr. Shorn: It is a very refreshing viewpoint, Dr. Wheeler, and I would like to see it generally held.

## Summary

Dr. Gold: We may now summarize briefly a few of the essential points concerning the treatment of Graves' disease which have been brought out in the course of the remarks this morning. The measures used at the present time for the control of this disease find their rationale in the present concept of the nature of the disease. The hyperplasia of the thyroid tissue, the enlargement of the gland as a whole, and its hypersecretion, play a prominent role in the clinical picture. but represent only a part of it. Graves' disease is a systemic disorder of a very complex nature involving, besides the thyroid, other structural, physiologic, and chemical changes. Patients who develop this disease have a constitutional predisposition, with characteristics similar to those who develop ulcer. There is a strong familial tendency. This disease belongs among the group of psychosomatic problems. The patient's environment and capacity for mental adjustment to life's situations play an outstanding role in the causation of the disease. Emotional impacts are precipitating factors; also disorders of nutrition, infections, and such unstabilizing influences in the endocrine system as occur in puberty, menopause, and pregnancy.

Among the manifestations of the disease which were discussed were nervousness, emotional instability, loss of weight, increase in the basal metabolic rate, hyperplasia and enlargement of the thyroid gland, disorder of carbohydrate metabolism with glycosuria and abnormal blood sugar curve, increased protein metabolism, calcium imbalance, and disorder of creatine metabolism.

There are changes in the liver and destruction of muscle tissue. The term "masked hyperthyroidism" applies to those cases of Graves' disease in which only part of the clinical picture is present in which the nervous symptoms outstanding in the classical case are in abeyance, more especially those types in which the predominating symptoms relate to the cardiovascular and gastro-intestinal systems.

By far the majority of cases of Graves' disease come to operation. The most serious aspects of the disorder subside after a successful subtotal thyroidectomy. It is not, however, the complete solution of the problem. Many symptoms remain. The medical treatment of Graves' disease is, therefore, of paramount importance, in a few cases as the sole treatment, and as pre- and postoperative treatment in the others. Meticulous attention to the control of psychic factors is an outstanding requirement of any plan of treatment of the patient with Graves' disease. Sedatives in appropriate amounts sufficient to control nervousness are helpful. They should be used in only moderate doses; more than 30 mg, of phenobarbital a few times a day are not necessary and may lead to toxic disturbances.

Iodine administration plays a significant role in the treatment. There is some difference of opinion regarding the amount of iodine and the length of time it should be given. There is a tendency to give more iodine than appears to be necessary. There is evidence that the iodine requirements of the patient with Graves' disease may be well satisfied with doses of 6 to 15 mg. (0.5 to 1 cc.) of syrup of hydriodic acid daily, and there is some question as to whether the very large doses, such as 1 cc. of Lugol's solution (125 mg. of iodine) daily, are necessary. The view has been expressed that the "escape" of the patient in an "iodine remission" may be due to laxity in the control of the emotional factors which play a dominant role in precipitating active symptoms of Graves' disease.

There is indication that the use of radioactive iodine and the new drug, thiouracil, marks a significant advance in the nonsurgical management of Graves' disease.

The details of the preoperative treatment of Graves' disease, the postoperative treatment, the treatment of postoperative vomiting, and the complication of the thyroid crisis were discussed.

## NEGRO CENTER FOR MATERNAL CARE

A new maternity center for Negro patients, operated by Negro professional groups under white supervision, has been organized near Birmingham, Alabama. Slossfield, as it is called, has developed into an important teaching center for Negro physicians and nurses. Already it has served to raise the standards of obstetric and neonatal care. . . . Both

maternal and neonatal mortality have shown a striking reduction. The influence of this endeavor will be widely felt; similar ventures may well be initiated and supported in the North as well as in the South, so that maternal care for Negroes may be elevated to that of the rest of the community.—J.A.M.A., Feb. 19, 1944

## Case Report

## TETRAPLEGIA RELIEVED BY REMOVAL OF CORD TUMOR

ARTHUR ECKER, M.D., Syracuse, New York

IT IS important to be reminded that even though cervical arthritis may be roentgenographically demonstrable, root pains referred to the neck and shoulder may really be due to a spinal cord tumor. The following case report illustrates this fact. also lends support to the observation that dissociation of anesthesia is a frequent accompaniment of lesions of the cervical portion of the cord and does not necessarily indicate an intramedullary lesion. Furthermore, this case illustrates the advi-ability of offering surgical relief in cases of spinal cord tumor even though the neural disability has gone to the stage of paralysis of all four limbs and marked limitation of respiratory movement. Finally, the case to be presented illustrates the fact that atrophy of the hands in cases of high spinal cord tumor is recoverable following relief of pressure from the

#### Case Report

The patient was referred by Dr. F. J. Mahrer, on August 19, 1941, because of progressive paralysis of all four limbs. The patient was a 50-year-old Italian woman who had had a persistent fistula on the anterolateral aspect of the right side of the neck for thirty years. The rest of the past history and the family history were noncontributory.

For eight years the patient had had pain in the right side of the neck and shoulder. This pain reliable to the side of the neck and shoulder.

radiated to the region of the deltoid muscle and was made worse when she strained. For four years there had been progressive numbness of the right upper limb and for three years progressive weakness of both arms. For two years the patient had been unable to move her toes and there had been progressive numbness of both legs. For eight months she had needed help in walking and six weeks before admission her legs had become completely paralyzed. For a few days she had felt as though she were wrapped in a tight binder from the neck down. She also complained of severe generalized burning pain.

General physical examination revealed no abnormality except what was apparently a branchial cleft fistula in the right side of the neck and the neurologic changes to be described. There was practically complete flaccid paralysis of all four limbs. There was marked atrophy of the intrinsic muscles of the right hand, moderate atrophy in the muscles of the forearms, and some atrophy in the muscles of the lorearms, and some arrophy in the muscles of the upper arm, especially the deltoid. The patient was practically unable to move the fingers of her right hand and was unable to pronate or supinate the right forearm. There was very slight movement at the hips and shoulders. The or supinate the right forearm. There was slight movement at the hips and shoulders. maximal chest expansion from complete expiration

Abridgment of a paper presented at the combined meeting of the Syracuse and Utica Academies of Medicine, September 1911, at Rome, New York.

to complete inspiration was one-eighth inch (3 mm.) measured either at the upper or lower region of the thorax. Although there was a normal gag reflex and the larynx was not paralyzed, the patient was unable to cough because of the paralysis of the respiratory muscles. There was hypoesthesia and hypalgesia throughout the entire body up to the third cervical segment. Both upper limbs were analgesic. Joint sensation was absent in the right hand but normal in the distal portions of the other three limbs. The tendon reflexes were all increased. There was transitory patellar clonus on each side and ankle clonus on the right side. Hoffmann's and Babinski's signs were present on each side. The abdominal reflexes There was tenderness over the were absent. spinous processes of the third and fourth cervical vertebrae.

Routine roentgenograms of the cervical spine revealed evidence of infectious arthritis with productive bone change between the fifth and sixth cervical There was neither enlargement of the intervertebral foramina, erosion of the pedicles, nor evidence of platybasia. Lumbar puncture revealed a clear, colorless fluid which was under pressure of 8 cm. of water, and which contained 167 mg. of total protein per 100 cc. There was no response to bilateral jugular compression.

The preoperative diagnosis was extramedullary cord tumor on the right side opposite the third cervical vertebra, probably meningioma or neurofibroma. It was decided to perform the operation under local anesthesia in order not to increase the secretions in the upper respiratory tract and to maintain the gag reflex.

Operation was performed on August 26, 1941. Because right hemilaminectomy yielded inadequate exposure, laminectomy of the first five cervical vertebrac was performed. The patient was never in respiratory distress and her blood pressure was maintained at about 110 mm. of mercury systolic by venoclysis of plasma. The dura was under increased tension and did not pulsate normally. When the dura was opened, there was seen an extramedullary cord tumor which displaced the cord to the left at the level of the atlas and just below it (Fig. 1). The spinal cord had to be retracted further to the left to permit complete removal of the tumor, almost half of which extended in front of the cord. After removal, the tumor resembled a disk, approximately 2.5 cm. in diameter and 1 cm. thick, which had been folded on the cord (Fig. 2). It was a neurofibroma which arose from the right second cervical nerve root. The cord had been crushed to about one-third its normal size and yet the patient breathed as well after the operation as before.

plained of being thirsty and was in good condition. Convalescence was uneventful and the wound healed by primary intention. On the first and second postoperative days there was occasional diffi-culty in breathing. This was relieved by spinal puncture and by the administration of oxygen. On

However, postoperatively, there was complete anal-

gesia in the feet. Closure was made without drainage. At the end of the operation, the patient com-

Fig. 1. Operative site showing tumor in situ.

the third postoperative day, pain sensation in both upper limbs returned. On the fourth postoperative day the patient began to perspire for the first time in three or four years, voluntary movement began, and the patient was able to cough. On the seventh postoperative day, she began to move the fingers of her right hand for the first time in three years. At this time sensation to pinprick and light touch was good throughout most of the body. Chest expansion was between one-quarter and one-half inch. On the minth postoperative day voluntary control of the bladder was present. On the fourteenth postoperative day spinal puncture revealed a clear, colorless fluid and prompt response to jugular compression, indicating freedom from subarachnoid block.

The patient was dismissed from the hospital on September 20, 1941, twenty-five days following operation. At this time she had good strength in the left lower limb, fair strength in the left upper and right lower limbs, and a little strength in the right upper limb. Touch and pain sensation were normal thoughout except for anesthesia and analgesia in the left fourth and fifth lumbar and first three sacral segments. There was perfect control of the bladder. At dismissal from the hospital the patient was unable to walk but was sitting up in bed. Although roentgenograms of the cervical spine revealed no dislocation, it was thought best to provide a plaster cast which was to be worn whenever the patient sat up or stood.

On December 2, 1941 (fourteen weeks postoperative) the patient said that she had not worn her cast as directed. However, examination revealed that the scar of the incision kept the head from being fully flexed. There was moderate weakness in the right deltoid and slight weakness throughout the rest of the muscles on the right side. There was moderate atrophy of the right thenar eminence. All the muscles in the left side were normal. The patient was able to walk a few yards by herself.

The patient was again re-examined on June 23, 1942 (forty-three weeks after operation). She had been feeling fine. She was doing much of her housework, including an appreciable amount of cooking, washing dishes, and even washing clothes. She had also done some knitting. She had an occasional sense of heaviness and burning in the right occipital region and a tendency to swelling of the ankles Examination revealed that the patient walked with a slight limp on the right and that she was able to walk on her toes. There was moderate limitation of all movements of the neck, and when the head was bent backward, there was pain radiating down the

Fig 2. Operative specimen, inner aspect.

lateral aspect of the right upper arm. Tenderness was localized to a site on the operative scar at about the level of the fourth cervical vertebra. Pressure on this site caused pain to radiate to the lateral aspect of the right upper arm. There was perfect movement of the fingers of both hands and normal grip. The intrinsic muscles of both hands showed no atrophy. Abduction and adduction of the fingers were normal. The patellar and right The left biceps reflex biceps reflexes were brisk. was diminished. Hoffmann's sign was still marked on the right but slight on the left. On plantar stimulation there was dorsiflexion of the right great toe without fanning of the other toes. There was normal plantar response in the left foot. Sensation was normal. Chest expansion at the lower border of the ribs was 3 cm.—that is, ten times what it was before operation. Roentgenograms of the cervical spine revealed no change in the arthritis previously described.

#### Discussion

Tumors of the cervical portion of the spinal cord have recently been reviewed by Craig and Shelden, who pointed out that atrophy of the muscles of the arm or hand was most commonly associated with tumors affecting the four lowermost cervical segments.

The present case is an unusual one because there was marked atrophy of the intrinsic muscles of the right hand while the tumor lay above the level of the second cervical vertebra. Furthermore, the atrophy disappeared seven months after the removal of the tumor.

A similar case was previously described in which atrophy of the hand disappeared eight months after removal of a tumor which arose anterjor to the medulla. It is significant that in both cases there was a large mass of tumor anterior to the uppermost portion of the spinal cord. It is likely that the tumor pressed on the anterior spinal artery and thus interfered with the circulation to the anterior horn cells in the lower cervical region. In any event, it is clear that atrophy of the intrinsic muscles of the hand may result from the presence of an extramedullary tumor on the anterior aspect of the uppermost cervical segment of the spinal cord and is a recoverable condition.

Gardner successfully removed a meningeal tumor from the region of the foramen magnum which had caused not only tetraplegia but also enfeeblement of respiratory movement and intermittent cyanosis as well.

The presence of roentgenologically demonstrable arthritis of the lower cervical spine may have been a pitfall in diagnosis in the early stages and may account for some residual symptoms, such as limitation of movement of the neck. As a matter of fact, the patient had refused to undergo lumbar puncture, which might well have led to the correct diagnosis at an earlier stage.

#### Summary

There is reported a case of tumor of the uppermost portion of the spinal cord which had progressed to tetraplegia with enfeeblement of respiratory movements. The tumor was removed successfully.

## NOTED EXPERT IN TRAINING OF DEAF JOINS RED CROSS

Continuing its efforts to provide all possible recreational and social services to war-injured veterans, the American Red Cross has obtained the services of Miss Betty C. Wright, one of the nation's outstanding pioneer social workers in the field of assistance to the deaf, it has been announced by Red Cross national headquarters.

Miss Wright, deaf herself, has been granted leave of absence from her post as executive director of the American Society for the Hard of Hearing. She will act as consultant to the Red Cross on special problems of war-deafened soldiers, dividing her time between Deshon General Hospital, Butler, Pennsylvania, Hoff General Hospital in California, and Borden General Hospital in Oklahoma. These hospitals have been designated by the Army for the special care of deaf veterans.

The appointment had the full approval of Col. M. R. Mobley, who developed the Army program for treatment of soldiers whose hearing is impaired

or lost in service. Born and educated in Virginia, Miss Wright worked with the deaf in the Navy during World War I, and has been with the American Society for the Hard of Hearing since 1923.

Re-education of such veterans is one of the Army's primary concerns. It is the Army's aim, as well as that of the Red Cross supplemental service, to allay the feeling of a veteran that he is shut off from sur-rounding activity. Everything possible is done to prepare him for civilian life, both practically and psychologically.

The Army's program, including specialized medical care, adjustment of acoustical devices, and teaching of lip reading, is supplemented by Red Cross hospital units which provide visual recreational activities and social services to the men while hospitalized. The units also assist in filing pension claims and provide information on vocational training. Families are carefully prepared through Red Cross channels for return of the handicapped.

It will be Miss Wright's aim, through the Red Cross hospital program, to bring to each deafened veteran the realization that he can be and is a productive member of society; that he has a wide choice in occupation, either immediately through the United States Employment Service or through retraining or special instruction; and that he is not shut off from activities he enjoyed before injury.

#### STANFORD UNIVERSITY RECEIVES GRANT FROM NATIONAL FOUNDATION FOR IN-FANTILE PARALYSIS

Realizing the acute need for physical therapy personnel, partly resulting from the war, the National Foundation for Infantile Paralysis has made a two-year grant totaling \$34,080 to the Stanford University Shahila Warnel ford University School of Health (Women) at Stanford University, California.

This grant, which is in addition to other funds given by the National Foundation to this University, is for the twofold purpose ofstrengthening the physical therapy technicians' school and of preparing syllabi and text materials for the use of physical therapy instructors and their students.

Under this program selected students will be provided specialized training designed to prepare them to become skilled teachers of physical therapy.

"The 1943 epidemic of infantile paralysis emphasized the serious lack of physical therapy technicians and qualified teachers," Mr. Basil O'Connor, president of the Foundation, said. "It would seem that the success of any attempt to develop a satisfactory corps of technicians in the United States would depend to a considerable extent on having adequately trained instructors engaged in teaching this subject, and suitable text materials."

# Case Report

## LEIOMYOSARCOMA OF THE DUODENUM

KENDRICK McCullough, M.D., Yonkers, New York

THIS case is unusual as regards type and location. While primary leiomyoma is fairly common in stomach and small intestine, the malignant form rarely occurs in the gastrointestinal tract, and only 10 cases have been previously reported in the duodenum in the summary of Hunning and Garland.¹ Out of a series of cases of malignancy of the small intestine reported by Mayo,² numbering 108, only 10 were leiomyosarcoma and of these only 2 were duodenal.

This case has a number of features in common with several of those previously collected. The onset was characterized by general weakness, pain in the upper abdomen, a palpable mass in the left upper abdominal quadrant, anemia, and persistent high temperature. The sequence of ulceration of the tumor, sinus formation within the primary growth, formation of secondary abscesses in other organs, found in 4 of the previous cases (Von Salis, Foshee and McBride, Andersen and Doob, Hunning and Garland papeared to underlie many of the above symptoms, and the clinical picture was that of an inflammatory process. The precipitating cause of death was the multiple abscesses and not the presence of the tumor or its metastasis.

A diagnosis of leiomyosarcoma may be made in the presence of an upper abdominal mass with accompanying signs of inflammation, such as continued high temperature, pain, weakness, and anemia, and in the absence of the signs of gastric ulcer or carcinoma or neoplasm of the pancreatic head, and without bacterial evidence of any specific enteritis.

#### Case Report

A white woman of 42, admitted twenty-two days before death, had a persistent high temperature, headache, general weakness, and pain in the left flank. The duration was not known, but she had had a similar attack several months before. Her past history showed little beyond the usual childhood diseases, three pregnancies, no miscarriages, some excess of blood and clots with each menstruation.

Examination on admission revealed poor nutrition, waxy pallor, clevated temperature, and semistupor. Respiratory excursions were increased with dyspnea, and no dullness on percussion. The heart showed no apparent enlargement, no murnurs, rubs or thrills; the rate was accelerated but regular, and the blood pressure was 130/88. The abdomen showed a soft mass in the left upper quadrant, but no evidence of free fluid. The liver edge was palpable. X-ray showed a suggestion of a soft tissue mass in the left upper abdomen, displacing the intestines. There was marked anemia,

Read at the Annual Meeting of the Medical Society of the State of New York, Buffalo, May 4, 1943. From the Bureau of Laboratories, Department of Public

From the Bureau of Laboratories, Department of Painte Health, City of Yonkers, New York, Dr. Ward H. Cook, Director. Case of Dr. L. A. Volino, Youkers General Hospital.

1.5 to 1.6 million red blood cells, with improvement after transfusion to 2.9 million, the hemoglobin rising from 15 per cent to 48 per cent, Sahli. The red cells were often large, varied much in size and shape, and an occasional normoblast was present. Leukocytes were numerous, 23,000-28,000, with many neutrophils.

Bacteriologic examination showed little definite result. There was no agglutination by the patient's scrum of Bacillus typhosus, paratyphosus A or B, abortus or tularensis. The typhoid group of organisms, B. typhosus, paratyphosus A and B and dysenteriae, was not found in the feces. Two blood cultures, taken the day of admission and one week after, gave no growth. The Wassermann

reaction was negative.

Progress notes mention the continued high temperature, which varied within one degree of 102 F., with occasional peaks of 104 and 105 F. The mass was always palpable and felt round and freely movable. X-ray showed the kidneys to be in usual position and of the usual size. Sulfadiazine and sulfathiazole did not seem to affect the patient's condition. In the last week the right costal margin became tender and rales appeared in the left side of the chest. Death followed increasing weakness and dehydration.

The autopsy, done six hours after death, showed the body of a white female of early middle age, 159 cm. long, weighing about 55 Kg., without rigor and with slight dependent lividity and edema of the ankles. Nothing unusual appeared on external inspection. The incision showed no excess fluid in the abdomen. The serous surface was smooth and glistening, but with some vascular congestion about the duodeno-jejunal junction, which was displaced forward. Dissection of the gastrointestinal tract showed a normal-appearing stomach and first and second portions of the duodenum. The third portion had a mass in its posteromesial wall just after it had crossed the aorta. The mucosa over this showed a circular opening with slightly raised edges.

The mass was nearly spherical, 8 cm. in diameter, and appeared to lie in the duodenal wall. It was composed of firm gray tissue with a smooth and glistening cut surface. There were many branching sinuses running through it and opening into the defect in the mucosa. They were lined by soft, pale-yellow tissue and contained thick, grayishyellow liquid. There was a complete capsule separating the mass from the tail of the pancreas and the other retroperitoneal tissue. Nothing unusual was

found in the rest of the intestine.

The liver weighed about 2,300 Gm., showed many abscess cavities, the largest in the center of the right lobe, 10 by 7 cm. They were lined by thick, rough, pale gray, soft tissue and contained thick, greenish-gray liquid. One solid white nodule, 0.5 cm. in diameter, was found in the hepatic substance. The hepatic tissue outside the cavities was smooth, pale brown, and homogeneous. The uterus was of normal size, but its wall contained two encapsulated firm white masses, 2 and 3

Fig. 1. Longitudinal cut through tumor showing sinus opening on mucosal surface.

cm. in diameter. Other abdominal organs showed no unusual features.

The thorax showed normal-appearing right pleural and pericardial cavities and mediastinum and complete obliteration of the left pleural space by loose fibrinous adhesions. The heart weighed 350 Gm.; it showed no valvular or coronary abnormalities. The muscle was soft and flabby, pale reddish gray. In the left ventricle, one of the columnae carneae attached to the septum showed a small cavity, 0.6 cm., within the substance, filled with thick gray liquid. Much of the lower lobe of the left lung was occupied by firm, pale gray tissue, excavated by many abscesses filled with thick, yellowish-gray liquid and lined by soft, rough, gray material. The rest of this lung and all of the right were crepitant, pale gray, without consolidation. Bronchi showed rough, grayish-red mucous membranes.

Histologic examination of the duodenal mass showed complete ulceration of the mucosal surface, tumor tissue with congested vessels just beneath, covered by leukocytes and fibrin. The sinus opening here and branching through the tumor was filled with leukocytes and necrotic material and lined by leukocytes and fibrin. The mass extended from the ulcerated mucosal surface down to the inner layer of the muscularis, with which it was contiguous. The cells of the mass were of spindle shape, slightly larger than the fibers of the muscularis, with oval nuclei lying parallel to the long axes of the cells. In the deeper portion the cells had pale-staining nuclei and eosinophilic cytoplasm like those of smooth muscle, but they ran in all directions, interlacing, instead of lying in regular bundles of parallel cells. Near the surface they showed larger, hyperchromic nuclei, occasional giant nuclei, and many mitotic figures. On staining by the Vice Circumstant and the cells and nuclei of by the Van Gieson method the cells and nuclei of the tumor appeared yellow, and there was a very delicate fibrous stroma which took a red stain.

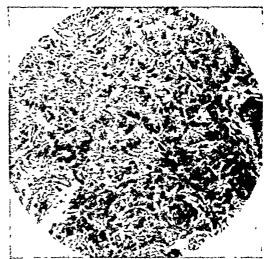

Fig. 2. Photomicrograph of tumor.

In the tumor were many congested capillaries, often containing many leukocytes, and there were scat-tered leukocytes. The small nodule in the liver was the only metastasis found. It was composed of spindle-cells which took the yellow of Van Gieson's stain. The cavities in the liver, in the lower lobe of the left lung, and in the columna carnea of the heart were filled with leukocytes, lined by fibrin, and surrounded by dense granulation tissue. The uterine masses were leiomyomata, but with no sign of malignancy.

Culture from the sinus in the duodenal tumor and from the abscesses in the liver gave growth of Streptococcus viridans, which produced only a small amount of methemoglobin. Mixed with this were Staphylococcus aureus and B. coli in small numbers.

#### Summary

A case is reported of leiomyosarcoma of the duodenum, complicated by ulceration, sinus formation, and metastatic abscesses of liver, lung, and heart muscle.\*

Even with the comparatively low rates of tuberculosis mortality prevailing these days, it is estimated that in the entire world tuberculosis still causes more than two million deaths in a single year. Godias Drolet, in Clinical Tuberculosis, edited by Benjamin Goldberg, M.D., 1942

## Tuberculosis Abstracts

## Hemorrhage in Pulmonary Tuberculosis

Pulmonary hemorrhage is one of the most distressing phenomena encountered in medical prac-The patient is gravely alarmed and the physician is confronted by bleeding that comes from a point deep within a delicate organ enclosed in a rigid framework. To combat the bleeding there may be only slowly or doubtfully effective physio-

logić mechanisms.

Psychologic effects to one side, hemoptysis generally is indicative of serious pulmonary disease. It is recognized that unexplained blood-spitting must be considered due to tuberculosis until proved otherwise. However, occasional causes include such nontuberculous diseases as bronchiectasis, bronchogenic carcinoma, lung abscess, rheumatic heart disease, and various minor nose and throat affections. People apparently in good health and presenting negative physical signs and few or equivocal roentgen findings represent especially puzzling problems when they report having coughed up blood. In all cases it is essential that we exhaust every means at our disposal of tracking down the reason for obscure lung hemorrhage.

The causes of hemoptysis are still not clearly understood. Blame has been laid on deficiency in one of the factors concerned in blood coagulation, on tonic, nervous, or endocrine factors, on erosion of a vessel wall by a tuberculous process, on rupture of a small aneurysm within a cavity. While the most serious hemorrhages occur in old, fibro-ulcerative tuberculosis, small or moderate hemoptyses may be seen in early disease, sometimes as the first recognizable symptom. Softening of a lesion or progression of an established process may be accom-

panied by hemorrhage.

Among 1,000 patients consecutively discharged from the Blue Ridge Sanatorium, Charlottesville, Virginia, only those were included in this study who gave a clear-cut history of spitting up one dram or more of blood, or who suffered a hemorrhage during their stay in the institution. "Streaking," "streaked sputum," and indefinite history of hemoptysis were excluded. In all, 905 cases of tuberculosis, made up of 424 males and 481 females, included 220 who had hemoptyses during the active phase of the disease. This is an incidence of 24.3 per cent, regardless of the duration of observation.

Some of the largest hemorrhages in this series occurred in a few patients showing bronchiectasis or rheumatic heart disease. Bogen, including in-stances of streaks and clots, found that over half of his hemoptysis cases expectorated less than two ounces of blood. The present study records 106 hemorrhages of stated amount, ranging from one dram to two quarts, the average being five ounces. This did not include repeated bleeding from the same individual on the same or subsequent days. since these were not felt to be distinct episodes, but more or less a continuation of the first. In approximately 40 per cent of the cases the episode of hemoptysis was repeated at least once.

Hemorrhage was the presenting symptom, often the initial evidence of trouble, in 60 cases. Perhaps nothing drives a patient to seek medical advice faster than the expectoration of a single mouthful of blood, although 23 patients did nothing about

their initial hemorrhage.

When the local physician was consulted by persons with hemorrhage in cases of previously un-

diagnosed tuberculosis 70 per cent were properly diagnosed, though it is estimated that 84 per cent correct diagnoses could have been reached by further

Only 49 cases in the entire hemoptysis group failed to show a cavity on x-ray examination and of these 11 were found to be nontuberculous. No less than 83.4 per cent of the tuberculous cases with hemorrhage had a positive sputum! Of the 170 patients in this latter category, 159 had roentgenograms revealing consolidation, honey-combing, punching out, or frank cavitation.

Correlation of hemoptysis with physical exertion, with direct chest trauma, or with mechanical dis-turbance of the lung is possible in some cases, though hemorrhage may and often does appear when the patient is at rest, perhaps during sleep, In only 28 cases in this study was there either a specific history of a precipitating factor or of its absence. In 10 patients hemorrhage was related

to one or more menstrual periods.

Among the graver consequences of pulmonary hemorrhage must be listed strangling and asphyxia from massive bleeding, fatal blood loss in the cachectic patient, and the commoner and everpresent danger that blood from a cavity which is generating a positive sputum will spread the infection to other parts of the lungs, giving rise to an acute tuberculous bronchopneumonia or a massive caseous pneumonia. Obviously, repeated episodes of blood-spitting multiply the chances for such complications to occur.

Summary and Conclusions
1. In a study of 1,000 sanatorium tuberculosis patients it was found that hemorrhages occurred in 24.3 per cent of them. 2. The average size of hemorrhage was five

ounces. Forty per cent of hemorrhages were eventually repeated.

3. In 60 patients, the first remarkable symptom

was hemoptysis. 4. Seventy per cent of cases with a history of hemorrhage before diagnosis were properly diagnosed by the local physician, when he was consulted.

However, 13 per cent were misdiagnosed. 5. Most tuberculous patients who hemorrhage have cavitation visible on x-ray examination; 83.4 per cent of this series had a positive

Trauma to the chest, strenuous exercise, mechanical disturbance of the lungs and, in females, the menstrual period are definite precipitating fac-

7. Small hemorrhages often occur from early lesions at the height of the catarrhal and toxemic symptoms which probably signify softening. These are not usually serious and may, in the long run, be beneficial if they call attention to an undiagnosed tuberculosis. However, larger hemorrhages which occur in chronic ulcerative tuberculosis, while rarely immediately fatal, are accompanied by many unpleasant and dangerous possibilities. Of the twelve deaths which occurred in the sanatorium after hemoptysis, it is felt that five were directly or indirectly the result of the hemorrhage.—Hemorrhage in Pulmonary Tuberculosis, George R. Minor, M.D., American Review of Tuberculosis, August, 1943. Reprinted from Tuberculosis Abstracts, January, 1944

## Mental Aspects of Aviation Medicine

More than two million persons now fly each year, exclusive of military flying, and, therefore, every practicing physician must have knowledge concerning the effect of flying on the human economy, said Colonel Eugen G. Reinartz, Medical Corps, U.S. Army, Commandant, School of Aviation Medicine Randolph Field, Texas, in a recent address. A percon might fly in spite of a physical handicap, he said, but with a marked handicap of psychogenic origin, loss of stability, or improper coordination of mind and body, flying would be unthinkable. Some take flying training in their stride, and weather all the new stresses imposed upon them, while others are unable to sublimate their difficulties. An important fact brought out by Colonel Reinartz was that war conditions and the exigencies of the Service had produced no novel or unique phenomena. He then discussed some of the syndromes encountered by flight surgeons in aviation.

Aeroneurosis.—This functional nervous and psychic disorder occurs frequently in aviators and is characterized by gastric distress, nervous irritability, minor psychic disturbances, fatigue of the higher voluntary mental centers, insomnia, and increased motor activity. It may develop in persons who are undergoing flight training, but is more likely to occur in those with whom flying is a profession. The principal exciting causative factor is emotional stress.

Serious airplane accidents invariably produce profound psychic shock, the effect of which on the central nervous system cannot be accurately evaluated. The witnessing of crashes and the death of one's friends in the most violent type of death known leaves a lasting emotional scar. In order to fly, such experiences must be repressed and in the repression new conflicts may arise. The instinct of self-preservation always brought into play in flying frequently arouses emotional disturbances, and although the fear engendered is repressed, the effects of the subconscious nervous trauma are cumulative and have a distinct bearing on the development of aeroneuro-

Anoxia.—Experimental work on the effects on the brain of repeated anoxia indicates that prolonged periods of significant oxygen deprivation never leave the brain unharmed. These experiments seem to point to the possibility of a gradual lowering of cerebral pressure in persons repeatedly exposed to an in-adequate supply of oxygen. These findings are of great significance since the war in the air, at almost unheard of altitudes, has assumed such large proportions.

Aeroembolism.-This condition is described as a disease produced by a rapid decrease of pressure below one atmosphere, such as may occur in aircraft flights to high altitude and which is marked by the formation of nitrogen bubbles in the body tissues and fluids. The formation of nitrogen bubbles in the body at high altitudes is fundamentally the same physical process as is found in "caisson disease" or "bends." The symptomatology depends upon the portion of the anatomy in which the bubbles of nitrogen lodge. In the spinal fluid, they cause increased intracranial pressure with attendant symp-In the tendons, fascia, periosteum, nerve sheaths, and bone, they cause pain. Nerve pain may be in the form of a descending neuritis with marked tenderness along the course of the whole nerve, or it may be only peripheral, affecting the nerve endings.

The most frequent site of pain is around one or more joints and this is usually the first indication of an impending attack of aeroembolism. may be mild at first, but rapidly becomes almost intolerable. The prophylactic treatment of this condition is, of course, the restriction of flying below levels at which this disease is likely to occur.

Airsickness.-While airsickness, from a purely medical aspect, is ignored by many, it is nevertheless a major problem in aviation. Candidates for flying training who give a history of seasickness, car sickness, train or swing sickness, usually develop air-sickness in training. The seriousness of an attack and its effects are not limited to the exact time of flight, but may cause a disability lasting hours after the flight is concluded. There is no case on record of permanent ill effects or of death from airsickness. Airsickness is not only one of the most far reaching but also one of the most important unsolved problems of aviation medicine.

Epilepsy.-The electroencephalograph is being used for the detection of the frank epileptics, and the possible detection of those who have the epileptic type of personality and reactions without experiencing the seizures. The types of electroencephalograph patterns found in successful pilots and unsuccessful "wash outs" are being studied with the view

of aiding in the selection of pilots.

Fear.—Fear in some form or another is frequently experienced while flying. This is especially true in combat flying. If the effort is long continued, fatigue sets in and creates a fear of incapacity, fear of failure, and a fear of inferiority. It is common sense to be afraid of real danger. It is the problem of the flight surgeon to elucidate, to beginning flyers especially, the facts of the situations in which they find themselves. Real knowledge is one of the best antidotes for unfounded fear.

Noise.—It is a matter of common knowledge that very loud sounds produce sensations of discomfort, at times amounting to acute pain and with persistent ringing in the ears. Any factor, such as noise, which tends to lower the physiological level of activity of an organ is especially undesirable in pilots who are exposed to anoxia and other resultants of altitude.

Cold.—The effect of cold on flying personnel has been the subject of much study. While some experiments are conducted at actual altitudes in airplanes, most of the research has been done in the refrigerated altitude chamber, where conditions can be better controlled. It is hardly possible to keep warm in the low temperatures encountered at high altitudes. All manner of symptoms arise, beginning with the sensation of chilliness and progressing to actual pain. The hands and the feet are the first to be affected. Some of the most serious effects of cold upon the pilot are those in the psychic field and are due to the physical

discomforts experienced.

Vibration.—Vibration generally creates tenseness and muscle fatigue. This may be due to the action directly on the muscles and bony framework or may be due to the mental effect produced by vibration with its secondary tensing of the musculature. Whatever the reason, fatigue results.

In conclusion, Colonel Reinartz states that much important research is being carried on in the psychiatric aspects of aviation medicine. It is a vital problem to which the medical profession is giving increasing consideration .- Medical Record

# Declares the Motor Unfitness of Our Young Men is Appalling

The proportions of motor unfitness among young men are appalling, Thomas K. Cureton, Ph.D., Urbana, Illinois, declares in the Journal of the American Medical Association for September 11, 1943 in a report of his findings from a study of the motor fitness of young men at the University of Illinois. By motor fitness is meant the capacity to run, jump, dodge, fall, climb, swim, ride, lift and carry loads, and endure long hours of continuous work.

From his study Dr. Cureton also presents the

following conclusions:

"Physical training programs are not compensating rapidly enough for urbanization with its associated mechanization, indoor work, dependence on motor vehicles, and lack of the necessity of hard physical

work in youth.

"Large numbers of young men are entering adult life unconditioned and unmotivated to maintain physical fitness. This trend may contribute greatly to high accident rates, rapid loss of health after the age of 30, and widespread chronic disease because of the lack of preventive hygiene and conditioning work for the body.

"Physical education and recreational programs have been inadequate, possibly because of inadequate time, facilities, and leadership. In addition, the programs too infrequently focus on the physical fitness objective in terms of big muscle and organic endurance criteria. The socialization of the programs has possibly hurt the conditioning value of the activities. Many activities, such as bowling, dancing, socialized games, archery, bait and fly casting, badminton, and tennis, possibly contribute very little as they are taught in typical physical education or recreation classes.

"Basic motor fitness training would include deliberate emphasis on ability in a wide range of activities for balance, flexibility, agility, strength, power, and endurance, apart from health knowledge, rules of the game, social play relations, or form in refined physical skills.

"The fact that 60 per cent of those failing to pass the motor fitness test cannot swim 100 yards, and 85 per cent of these cannot swim 440 yards, is a deplorable fact which indicates lack of organization in the schools to teach the important skills of swim-Thousands of drownings in the war are directly attributable to this omission. . . .

"These facts imply the great importance of physical fitness work from the dynamic approach as used in physical education. The findings suggest a fruitful area of work of primary importance

from the health and safety point of view.

In his report Dr. Cureton explains that "The medical and public health reports of the Metropolitan Life Insurance Company and the Medical Division of Selective Service do not indicate the extent of unfitness of young men in motor fitness, but deal with the more general health aspects involving teeth, eyes, heart, ears, feet, lungs, hernia, musculoskeletal defects, and venereal diseases..." He points out that in the Navy rejections have averaged 54.9 per cent and in the Army about 50 per cent, and says that this has been pointed out as constituting a problem of national concern and importance and should call for immediate investigation and a prompt remedy. "However," Dr. Cureton declares, "there is another side to the picture which is overlooked in these medical reports but which is of primary importance to the immediate needs of the

armed forces. This is the state of young men in the dynamic aspects of motor fitness. . .

"Physical ability involving balance, flexibility, agility, strength, power, and endurance in a variety of performances sums up to motor fitness. A bad gap or blind area of development in any of these aspects will result in physical inefficiency in a large number of related performances. Motor fitness emphasizes the more generalized gross and funda-mental physical abilities which are dominated by development of the kinesthetic sense [by which muscular motion, weight, position, etc., are perceived, muscular energy, and suppleness of the tissues and joints, including the aspects which are basically involved in athletic or work skills with the big muscles of the body rather than the finer or low energy precision skills. . . . .

"Balance represents neuromuscular control paral-leling the development of the kinesthetic sense in acts of sitting, skating, riding, tumbling, walking logs or fences, skiing, dancing, and a host of everyday skills. Many people are handicapped because they fall and get hurt at the slightest provocation, slip on a rug, slip in the shower or in the pool or tub, or when they dismount from a moving vehicle. The greatest number of serious accidents are due to falls involving poor awareness of unsteadiness or lack of compensating control. Many adults cannot ride a bicycle, skate, swim, or ski. They are unsteady in shooting or fall easily from moving vehicles. Some do not readjust quickly to experiences in which the body is turned or revolved. Balance in this sense is educable, it can be learned by gradual education of the kinesthetic sense in a variety of balance stunts.

"The more natural and important these are the better, but good preliminary training is associated wi

. ility to move easily in the full range of joint movements, to tuck up tightly, to bend easily at the waist, to twist the spine easily, to point the toes fully and to breathe deeply and fully without much extra effort. . . .

"Agility emphasizes the capacity for fast reaction in controlled nimble movements, 'rabbit-like' in action, and to move quickly, dexterously, and easily. . . . Strength emphasizes the capacity of the hands, legs, or trunk to exert great force. . . . Power emphasizes the capacity to release great explosive force to sudden violent efforts. . . . . . Endurance is capacity for continuous exertion, involving in the first minute or two severe depletion of the oxygen reserve and the development of oxygen

debt with severe distress...."

Presenting an analysis of the motor fitness of 2,628 young men entering into the University of Illinois in September, 1942, Dr. Cureton says that they were fresh from high schools of Illinois and nearby states. The results were startling because among the 35.84 per cent who failed to pass the test the preparties of failures in fourteen basic test the proportion of failures in fourteen basic tests is so high "that concern should be manifested for the physical and health future of the men. For instance, 79 per cent could not lift the legs from the floor twenty times while lying on the back and then do twenty sit ups in succession. This standard is not very high, because a fit man can do as many as one hundred leg lifts and two hundred to five hundred sit ups. Some 78.8 per cent could not chin themselves ten times in succession, and 76.1 per cent could not jog a mile in seven minutes, a very

mediocre performance for any one who has the ability to run the distance...."

The findings in swimming ability were also significant. Of 2,557 who responded to a swimming

questionnaire, 679 men, or 26.55 per cent, said they could not swim at all, 40.13 per cent said they could swim 75 feet but not as much as 100 yards, and only 12.40 per cent stated that they were lifesavers.

#### LIBERTY SHIP NAMED FOR DR. TRASK

Dr. James D. Trask, one of America's most famous fighters in the war against infantile paralysis, was posthumously honored early last month when a Liberty ship named in his honor was launched at the Bethlehem-Fairfield shipyards in Baltimore.

As a salute to the late scientist and his colleagues who are carrying on polio research work through grants from The National Foundation for Infantile Paralysis in colleges, universities, and laboratories throughout the country, the National Foundation suggested the naming of the ship in honor of Dr. Trask. The ship was christened by his widow, with prominent scientists from Yale University and Johns Hopkins present at the launching ceremonies.

Dr. Trask, who died in Chicago on May 24, 1942, while working for an Army Medical Commission under an appointment as consultant to the Secretary of War, became internationally known for his work in infantile paralysis, a large part of it done with his close associate, Dr. John R. Paul of Yale University. The two men, who helped found the Yale Poliomyelitis Commission in 1931 after an epidemic of infantile paralysis swept Connecticut, made an outstanding team in the study of the disease.

In recognition of their work, Drs. Trask and Paul

received the first grant made by the Committee on Virus Research of the National Foundation after it was organized in 1938.

Together Drs. Trask and Paul published many papers on the disease and they were signally honored a month before Dr. Trask's death when they were awarded the John Phillips Memorial Medal at a meeting of the American College of Physicians.

Born in Astoria, New York, on August 21, 1890, Dr. Trask was graduated from the Cornell University Medical College and interned at Bellevue Hospital. A veteran of World War I, he served on the staff of the Rockefeller Institute for Medical Research, New York, from 1919 to 1921, when he joined the faculty of the Yale University School of Medicine as an instructor in medicine. In 1925 he was made an assistant professor of medicine and in 1927 an associate professor of pediatrics, retaining that position until his death. During the last month of his life he was working in Army posts in the Chicago area on problems of hemolytic streptococcus infection as a member of the Commission on Hemolytic Streptococcal Infections of the Board for the Investigation and Control of Influenza and Other Epidemic Diseases in the Army.

## NATIONAL FOUNDATION FOR INFANTILE PARALYSIS ISSUES FIFTH ANNUAL REPORT

On April 11, Basil O'Connor, president of the National Foundation for Infantile Paralysis, made public the Foundation's fifth annual report. A section of the report deals with the Kenny method and shows that since Miss Kenny's arrival in this country in 1940 over \$500,000 has been spent in testing the method and training doctors, nurses, and technicians in the technic.

The Foundation established Miss Kenny at the University of Minnesota, a center at which more than 900 doctors, nurses, and physical therapy technical management of the control of the con

nicians have been trained in the method.

Other centers of instruction in the modern treatment of poliomyelitis, including the Kenny method, have been opened at Stanford University, School of Health, California; Childrens' Hospital Society, Los Angeles, California; The Georgia Warm Springs Foundation Graduate School of Physical Therapy; New York University School of Education, New York

City; University of Pennsylvania Graduate School of Medicine, Philadelphia, Pennsylvania; and the D. T. Watson School of Physiotherapy in Leetsdale, Pennsylvania.

The report also shows that during the fiscal year the National Foundation made grants and appropriations in five main categories: virus research, aftereffects research, education, medical publications,

and epidemics and public health.

Mr. O'Connor recently made an intensive five weeks' tour of nine southern states, conferring with public officials, officers of the Army and Navy, and medical and health authorities, and addressing a series of meetings attended by officers and personnel of branches of the National Foundation.

The purpose of the trip was to bring before the public the role played by the National Foundation in the fight against infantile

paralysis.

## MORE PHYSICAL THERAPY EQUIPMENT NOW AVAILABLE

According to a release from the Office of War Information, restrictions on the manufacture and sale of physical therapy equipment were eased on April 7 by the War Production Board.

Medical practitioners and hospitals may now buy certain types of equipment that formerly were manufactured only for the armed services and lendlease, and medical practitioners may also buy other types formerly restricted to these groups and to hospitals, WPB announced. In addition, three types of physical therapy equipment, generally approved by the medical profession for home use, may now be sold to the public on prescription or order of a licensed medical practitioner.

### COMPARATIVE VALUES

We Americans, with our mixed racial strains, our varied hereditary characteristics drawn from many lands and many ethnologic types, have attained at least one common factor—acquired, perhaps, from an environment that has been overly generous to us. We are generous to others, particularly if a call is made in a way to appeal to our open, warm-hearted, somewhat erratic and at times exceedingly sentimental emotions. If anyone tries to take what belongs to us, we fight at the drop of a hat; but if the emotional floodgates are opened, we give it away. This characteristic is simply illustrated by the old story of the tough character and the flower girl: "Don't cry, little girl. I'll buy your -- violets

The journalistic gentry learned long ago to pluck the pulsing heartstrings of their public. Crime may go unpunished and injustice may pile unnoted upon injustice, but let son e columnist mention the fact that a cripple needs a wheel chair or a veteran requires a wooden leg, and the checks float down like a kindly Christmas snowstorm. The need must be specific and emotionally presented, the beneficiary must be an individual with a personality of sorts, but the response is hundredfold, if it is only a new wig that is requested.

Publicity (or propaganda, if you will) is one of the most powerful instruments that we possess, and a great trust-to use it well and wisely-is put into the hands of those who guide it.

We have seen recently an example of its effectiveness, regardless of how wisely or unwisely it was in this case directed, or whether it was initiated in the best interests of the public. A child suffering from an admittedly incurable chronic nephritis (presumably nephrosis) has had life maintained, or at least has been treated, by the administration of large quantities of blood plasma, the fluid for lack of which many an American soldier may be doomed to die this summer unless the American public is reawakened to its duty. A Boston newspaper, taking up the cause of the child, has obtained enough plasma from local donors to guarantee, it is said, some prolongation of life for the patient.

If journalism will now turn its considerable powers toward obtaining enough blood donors for the Red Cross to make up the deficit of plasma that threatens the effective treatment of our wounded soldiers and sailors, we shall congratulate it most wholeheartedly on the gesture it has made in behalf of the child.

# RATIONING DOES NOT CHANGE Mutritional Needs

As food availability decreases through increased ration control, many persons may be required to make drastic dietary adjustments to maintain their former health and vigor. These changes will be especially demanded of workers in essential and other industries whose energy expenditure is greater today than ever before. Regardless of curtailed food supplies, nutritional needs perforce remain unchanged, hence new means for their satisfaction must be employed.

Ovaltine provides an excellent answer to the problem of satisfying metabolic requirements in the face of more stringent rationing and food shortages. It provides the nutrients concerned with well-being and especially those whose lack is most likely to occur under food rationing. Three glassfuls of this delicious food drink may well raise the average diet to nutritional adequacy. Ovaltine is equally appealing as a mealtime beverage and as a between-meal snack.

THE WANDER CO., 360 N. Michigan Ave., Chicago 1, Illinois

# Postgraduate Medical Education

Programs arranged by the Council Committee on Public Health and Education of the Medical Society of the State of New York are published in this section of the Journal.

The members of the committee are Oliver W. H. Mitchell, M.D., Chairman (428 Greenwood) Place, Syracuse); George Baehr, M.D., and Charles D. Post, M.D.

## "Penicillin Therapy"

A SINGLE lecture entitled "Penicillin Therapy" was given before the Broome County Medical Society on May 16, 1944, in the auditorium of the Binghamton City Hospital, Binghamton.

The speaker was Dr. James E. McCormack, in-

structor in medicine at New York University Col-

lege of Medicine, New York City.

This instruction is provided by the Medical Society of the State of New York with the cooperation of the New York State Department of Health.

## Change in Sullivan County Series

R. RALPH STILLMAN will be unable to speak at the meeting of the Sullivan County society on June 14 at the Workmen's Circle Sanatorium as announced in the May 15 issue of the Journal.

His place will be taken by Dr. James E. McCormack, instructor in medicine at New York University College of Medicine, who will speak on "Penicillin Therapy."

## REPORT SHOWS PROGRESS IN CAMPAIGN TO PROTECT EYES

Protection of eyesight in industry and prevention of blindness from glaucoma, a disease which usually results in complete loss of sight unless treated by an eye physician, received special emphasis last year in the program of the National Society for the Prevention of Blindness, according to the annual report of its activities, made public by Mrs. Eleanor Brown Merrill, Executive Director.

"The war naturally tends to bring into sharp focus those activities which tie up with the war effort. the report explains, "but the continuous needs must

Some of these needs are: the restoration of sight, where possible; the promotion of educational facilities for children whose eye conditions make it impossible for them to use ordinary school equipment, as well as improving the eye hygiene conditions in schools, offices, factories, and homes; provision of information to the public and to professional groups such as nurses, teachers, medical social workers, safety engineers; and the early detection of eye diseases and conditions which may result in loss of vision."

In a preface reviewing the beginnings of the organized movement for sight conservation, Mason H. Bigelow, President of the Society, recalls that "thirty-five years ago, a few pioneers decided to in-augurate a program to assure good eyes for tomor-row, and the National Society for the Prevention of Blindness is the agency which those pioneers de-

signed to effect their program.
"At that time," Mr. Bigelow points out, "more than 25 per cent of the children in schools for the blind were there because of one disease alone— ophthalmia neonatorum; today the number of children blind from that cause has been reduced by

75 per cent.
Then, there was not one sight-saving class in the United States; today there are 629 classes for children whose eyesight is so seriously defective that they cannot receive an education in the regular classrooms. Then, industry had only begun to use protective devices for eye safety; today such

measures are preventing thousands of eye injuries at

"Despite notable achievements, however, much remains to be done. The increased hazards in industry due to the speedup for war production and the employment of inexperienced workers undoubtedly will be reflected by a higher toll of eye accidents. Among the war casualties already returning are many who have lost an eye or have suffered other serious eye injury. The National Society for the Prevention of Blindness must seek to lessen the tragedy of these young men by planning for their rehabilitation. A program must be put into effect which will provide for the restoration of eyesight where that is possible, and for planning working careers for those who return with visual handicaps which cannot be corrected. Government agencies charged with these responsibilities are already drawing on the counsel of the Society.

"To meet the demands of today so that we can save eyes for tomorrow, this society needs more than ever the continued support of its 26,000 members and donors, as well as of the thousands of professional and lay workers who are engaged in the many aspects of sight conservation."

The Society assisted last year in the establishment of new state programs or the development of existing programs for prevention of blindness in Arkansas, California, Delaware, Florida, Maryland, Minnesota, Missouri, New Jersey, Pennsylvania, Rhode Island, West Virginia; and in Washington, D.C., Cannda, and Hawaii. Organizations engaged in similar work in Mexico and Central and South America were also aided.

Through the press, radio, and motion pictures, and through distribution of pamphlets and lectures by staff members, the Society's health education ma-terial reached the general public and numerous professional groups. More than 300,000 copies of

various pamphlets were distributed.

The Society's income in 1943 was \$169,454 and its expenditures amounted to \$173,526, necessitating the use of \$4,072 from the Reserve Fund.

# Procaine Hydrochloride and Epinephrine

The combination of the prompt and powerful local anesthetic action of procaine hydrochloride with epinephrine is very effective. With CHEPLIN'S PRO-CAINE HYDROCHLORIDE and

heprompt anesthetic thesia is prolonged through reacted absorption of the anesthetic. It also causes blanching of the operative area, thus giving the surgeon a clear field. Literature on request.

1% PROCAINE HYDROCHLORIDE and 1:25,000 EPINEPHRINE

is supplied for subcutaneous and intramuscular use in ampules and vials.

# Annual Meeting of Laryngological, Rhinological, and Otological Society

THE forty-ninth annual meeting of the American Laryngological, Rhinological, and Otological Society, Inc., is to be held in the Waldorf-Astoria Hotel in New York City on June 9 and 10.

The scientific program on June 9 will consist of the following lectures: "Experiences in a War Zone Since the Blitz," by Dr. Forrest J. Pinkerton, of Honolulu, Hawaii; "The Otoliths and the Part They Play in Man," by Dr. W. J. McNally, of Montreal, Canada, with discussion by Dr. Oscar V. Monfreal, Canada, with discussion by Dr. Uscar v. Batson, of Philadelphia; "Diabetic Gangrene Involving the Sinuses," by Dr. Ben R. Dysart, of Pasadena, California, with discussion by Dr. Samuel R. Skillern, Jr., of Philadelphia, and Dr. John J. Shea, of Memphis, Tennessee; "Disturbances of the Functions of the Salivary Glands," by Dr. A. C. Functions of the Salivary Glands, by Dr. A. C. Salivary Glands, "By Dr. A. C. Salivary Glands," by Dr. A. C. Salivary Glands, "By Dr. A. C. Salivary Glands," by Dr. A. C. Salivary Glands, "By Dr. A. C. Salivary Glands," by Dr. A. C. Salivary Glands, "By Dr. A. C. Salivary Glands," by Dr. A. C. Salivary Glands, "By Dr. A. C. Salivary Glands," by Dr. Salivary Glands, "By Dr. A. C. Salivary Glands," by Dr. Salivary Glands, "By Dr. Salivary Glands," by Furstenberg, of Ann Arbor, Michigan, with discussion by Dr. Thomas E. Carmody, of Denver, Colorado, and Dr. Emil F. Tholen, of Los Angeles; "The Comparison of the Hearing Improvement Following The Fenestration Operation and the Hearing Improvement Obtained with a Hearing Aid," by Dr. George E. Shambaugh, Jr., of Chicago, with discussion by Dr. Kenneth M. Day, of Pittsburgh, and Dr. Marvin F. Jones, of New York City; "The Aging Ear" by Dr. Edmund Prince Fowler, Sr., of

New York City, with discussion by Dr. Raymond C. Truex, of New York City.

The following lectures will make up the scientific program on June 10: "Otolaryngology on the High Seas," by Capt. Harry S. Schenck, (UUN), of Oceanside, California; "Audiometry in the Diagnosis and Treatment of Deafness in Children," by Dr. Walter Hughson, of Abington, Pennsylvania, with discussion by Dr. Harold Westlake, of Harrisburg, Pennsylvania, and Dr. C. Stewart Nash, of Rochester; "Traumatisms of the Frontal Sinuses," by Dr. Ralph A. Fenton, of Portland, Oregon, with discussion by Dr. Harris P. Mosher, of Marblehead, Massachusetts, and Dr. Robert F. Ridpath, of Philadelphia; "Cystadenoma of the Larynx—Report of Four Cases," by Dr. Frederick A. Figi, of Price of Minnesota with discussion by Dr. Report of Four Cases," by Dr. Frederick A. Figi, of Rochester, Minnesota, with discussion by Dr. Charles J. Imperatori, of New York City, and Dr. Gabriel Tucker, of Philadelphia; "The Pre-Epiglottic Space, Its Relation to Carcinoma of the Epiglottis," by Dr. Louis H. Clerf, of Philadelphia, with discussion by Dr. Frederick A. Figi and Dr. Henry B. Orton, of Newark, New Jersey.

A motion picture entitled "The Mode of Action of the Cricothyroid Muscle" will be shown by Dr.

the Cricothyroid Muscle" will be shown by Dr. Samuel Iglauer, of Cincinnati, Ohio, on June 10.

## First "Eye Bank" in Nation Opens at New York Hospital

THE nation's first "eye bank" for the collection and preservation of healthy human corneas, which surgeons can transplant to other patients with opaque corneas, restoring their sight, was founded on May 8 at New York Hospital.

Nineteen other hospitals in New York City and Westchester County will cooperate in supplying the bank with eyes and drawing from it. The National Red Cross Motor Corps will provide rush trans-portation to the bank for the delicate and precious

tissues.

A joint announcement from Stanley Resor, president of the Manhattan Eye and Ear Hospital, and Langdon P. Marvin, president of New York Hospital, predicted that the new eye bank may make it possible for sight to be restored to thousands of blind persons who are waiting to have the operation performed.

It was emphasized by both the hospital and the Medical Information Bureau of the New York Academy of Medicine that the operation, substituting healthy corneas for damaged ones, can restore sight in only one type of blindness—that caused solely by opacity of the cornea when the rest of the

eye and optic nerves are normal.

Corneas for transplanting are mostly obtained when it is necessary to remove an injured or dis-eased eye from a living patient. In relatively few cases a donor has submitted to an operation merely to supply a corned to another person, but these donations have invariably been from eyes which were sightless for reasons other than cornea defects.

Corneas from dead persons can also be used if removed within four hours after death. Such use is drastically limited in New York State, however, because the law requires the permission of the next of kin of the deceased, even though the deceased may have willed his eyes for such a use. By the time legal formalities are met it is usually too late to remove the eye.

Under the eye-bank plan the cooperating hospitals and their surgeons will notify the bank when an eye with a healthy cornea becomes available. The bank will dispatch the Red Cross Motor Corps

after it immediately.

Other hospitals in New York City cooperating in the bank project are the Beekman Street Hospital, Beth Israel Hospital, Bronx Hospital, Jewish Memorial Hospital, Lenox Hill Hospital, New York Eye and Ear Infirmary, New York Infirmary for Women and Children, Flower and Fifth Avenue Hospital, St. Francis Hospital, Sydenham Hospital, St. Vincent's Hospital, Beth David Hospital, Long Island College Hospital and Wyckoff Heights Hospital, both of Brooklyn, and the following Westchester County hospitals: Yonkers General Hospital, Grasslands Hospital in Valhalla, Mount Vernon Hospital, Tarrytown Hospital Association, and Dobbs Ferry Hospital.

## Army Medical Department Establishes Civil Public Health Division

MAJ. Gen. Norman T. Kirk, the Surgeon General of the Army, has announced the establishment of the Civil Public Health Division as a new organization with its principal function the formulation of policies and the development of plans for

public health programs in occupied and liberated territories during the military phase of future operations.

The division, part of the Preventive Medicine

For countless arthritics, regardless of the advancement of their affliction, treatment with massive dosage vitamin D has led to profound improvement, from dependable arrestment of the arthritic process to complete functional rehabilitation. Diactol is vitamin D<sub>2</sub> (calciferol), produced by selective irradiation of ergosterol, and is relatively free from intermediate irradiation products. In the recommended "individualized" dosage it is notably free from side actions. Administration over an adequate length of time, in a high percentage of cases, results in regression of periarticular soft tissue involvements, improves joint mobility, brings a new sense of well-being. The characteristic pain yields early, rendering the patient comfortable and more cooperative.

Physicians are invited to send for literature

THE PAUL PLESSNER COMPANY

35 YEARS OF ETHICAL SERVICE

MICHIGAN

Diactol, packaged in bottles of 100 s.g. capsules, is available on prescription through all pharmacies. It is notable for its reasonable price.

# [Continued from page 1258]

Service under Brig. Gen. James S. Simmons, will be under the immediate direction of Col. Thomas B. Turner, (MC), who has just returned from an extensive tour of the European and Mediterranean theaters of operations, where such programs are now functioning or are in the planning stage.

The program already under way will integrate the public health activities of the Army overseas with those of other agencies in this field, including the U.S. Typhus Commission, the Navy, the U.S. Public Health Service, the United Nations Relief and Rehabilitation Administration, and other

national and international health organizations.

The Allied armies will be called on to assume a measure of responsibility for civilian public health in many areas, entailing supervision of or liaison with local public health officials and the provision of certain necessary medical supplies.

To accomplish this objective it will be necessary to commission from civil life a number of officers experienced in public health administration and in specialties such as nutrition, maternal and child health, public health engineering, and laboratory technics.

Men who have had both general and special training in one or another of these special fields are being sought for such assignments in the Far Eastern area. They should not be over 50 years of age and should be physically qualified to perform at least limited service duties overseas. Previous military experience and knowledge of foreign languages is desirable but not essential.

The men selected will undergo a course of training at the School of Military Government, Charlottes-ville, Virginia, and thereafter in one of a number of civilian universities not yet designated. Instruction will include the theory and general principles of military government and liaison, and the language and background of certain Far Eastern areas. In addition, provision will be made for training men in special phases of public health and certain medical specialties.

Further information may be obtained by addressing the Surgeon General, U.S. Army, Washington 25, D.C., attention of the Civil Public Health

Division.—J.A.M.A., April 29

# County News

# Albany County

The monthly meeting of the county society was held in the auditorium of the Albany College of

Pharmacy on May 17 at 8:30 P.M.

The business session was followed by a lecture: "Experience with Tropical Diseases from the Various Theaters of the Present War," by Dr. Harold W. Brown, professor of parasitology at the College of Physicians and Surgeons of Columbia University, New York City. The discussion included practical points in the diagnosis and treatment of several tropical diseases which are being entered to the several tropical diseases which are the several diseases which are countered by our armed forces. Most of the time was devoted to malaria and filariasis, with a brief mention of the typhus group, hookworm, and dysenteries. The possibility of the introduction and establishment of these diseases in the United States through returning infected soldiers was considered.

Discussion of Dr. Brown's paper was opened by Drs. Robert Korns, Charles A. Perry, and William

Kaufmann.

A half century of active medical practice in the city of Cohoes was observed by Dr. John F. Mc-Garrahan on April 18, the fiftieth anniversary of his graduation from the Albany Medical College.

Pearce of Brooklyn, associate professor of pathology at Long Island College of Medicine, spoke on "The Cellular Response to Virus Infection." The other speaker was Dr. John R. DiPalma, also of Brooklyn, a resident in Medicine, Long Island College of Medicine, Kings County Hospital Division. His subject was "The Circulation of the Skin in the Shock Syndrome."

The spring meeting and dinner of the Associated Physicians of Long Island will be held on Tuesday, June 20, at the Wheatley Hills Golf Club, East Williston.

The scientific program will be held at 3:00 P.M. at the Club House. It will comprise four short papers on various subjects by Island members, discussed by Brooklyn members. There will be a brief business session at 5:30 P.M.

The dinner will be at the Club at 6:30 P.M.

### Nassau County

Hempstead, Long Island, was reported on April 24 to have become the first community in the United States to insure all its employees against medical expense. Mayor Herbert Mirschel has stated that the plan is already paying dividends in fewer work days lost and a sharpening of efficiency in all municipal departments.

The plan subscribed to is the Medical Expense

Fund of New York.\*

### New York County

The monthly meeting of the county society was held May 22 at the New York Academy of Medicine at 8:15 p.m.

J. Beeckman Delatour spoke on the program of the Committee for Recruitment and Education of Practical Nurses of the Practical Nurses of New York, Inc., and three speakers presented a symposium on neuropsychiatric problems.

posium on neuropsychiatric problems.

The symposium speakers and the titles of their addresses were: "Neuropsychiatric Problems in Ground Forces," by Col. William C. Porter, (MC), Army Service Forces, Mason General Hospital, Brentwood, New York; "Neuropsychiatric Aviation Problems," by Col. Walter S. Jensen, (MC), Deputy Air Surgeon, Headquarters, Army Air Forces, Washington, D.C.; and "Neuropsychiatric Problems of the Veterans Administration, by Martin Cooley, Veterans Administration, Washington, D.C. Discussion was by Dr. Foster Kennedy.

Dr. Wilbur A. Sawyer, director of the International Health Division of the Rockefeller Foundation, has been appointed Director of Health of the United Nations Relief and Rehabilitation Administration. Dr. Sawyer assumed his new duties June 1. His headquarters are in Washington, D.C.

Columbia University has announced the appointment of Dr. Harry B. van Dyke as professor of pharmacology and head of the department, effective next October 1. Dr. Arthur H. Milbert has been appointed assistant clinical professor of urology at New York Post-Graduate Medical School.

The resignations of Dr. John D. Lyttle as assistant clinical professor of pediatrics, effective May 1, and Dr. Dudley J. Morton as associate professor of anatomy, effective June 30, were accepted by the

board of trustees April 24.

# Oneida County

The Utica Observer-Dispatch of April 2 carried the following news item about a refugee doctor:

From East Prussia, by way of Italy and England, pursuing her medical education en route, Dr. Ursula K. Arnsdorff has come to Utica to be resident physician at the General Hospital.

Political events, more than time and space, have cut her off from Konigsberg, her native city, but Dr. Arnsdorff does not look back regretfully. "My home," she says, "is where I have good work and friends." Here she is finding both.

The variety of jobs that the General Hospital physicians encounter constitutes "good" work. "Diseases, drunks, babies," the doctor lists them. "Two babies last week—a black one and a white one." She has met no new situations in this variety, having worked in many hospitals, "but before I have not found so many things in one place."

Dr. Arnsdorff came to the Utica institution from the Kingston Avenue Hospital, Brooklyn. She had specialized in communicable diseases as resident for fifteen months. Previously she had served a year's rotating internship in the Lutheran Hospital, Brooklyn. She arrived in the United States three and one-half years ago and in 1942 was licensed to practice in New York State.

Dr. Arnsdorff left home alone in 1933, after Hitler's rise to power, and went to Italy to study. She was graduated from the University of Turin Medical School in 1937, then worked in the university hospital and in one near Milan. Meanwhile, her parents had got out of Germany and were living in London, where they are now. She went to London for another eight months of hospital training, later following her sister to Brooklym.

She had then to support herself and also to study for the state board examinations, and found it hard to get a job. She discovered how inadequate her school English was, but the least of her problems was learning our language. In six months among Italians she had picked up more of their language than she had learned of the French in ten years in a German school, she recalls, and she took to English as easily when she began working with Americans.

Dr. Ernest J. Weiss, of Rome, has opened an office in Oriskany. He is the first physician to have an office in Oriskany since the death of Dr. B. P. Allen several months ago.\*

### Onondaga County

Organization of a second Army hospital unit by Syracuse University's College of Medicine was revealed recently when the Second Service Command released an announcement that personnel of the unit had been called to active duty for one week, April 9-15, at Halloran General Hospital, Staten Island.

Fifteen Syracuse doctors are included in the unit, which is designated as Emergency Base Hospital Unit No. 11. It was organized in the fall of 1942 at the request of Dr. Thomas Parran, Surgeon General of the U.S. Public Health Service. Dr. Leon E. Sutton, with the rank of licutenant colonel, is

uccessful management of high blood pressure calls for a regimen which is adjusted to individual requirements. Physical activity is generally curtailed and overwork is avoided. In certain circumstances special diets are prescribed and the use of stimulants is restricted.

These measures are often supplemented with the administration of Theominal. This combined vasodilator and sedative aids in reducing blood pressure to a more normal level. As a consequence hypertensive symptoms are relieved and the risk of complications is reduced.

DOSAGE: The customary dose of Theominal is 1 tablet two or three times daily; when improvement sets in the dose may be reduced. Each tablet contains the obtomine 5 grains and Luminal\* ½ grain.

\*Luminal (trademark), Winthrop Chemical Company, Inc., brand of phenobarbital.

Supplied in bottles of 25, 100 and 500 tablets.

director of the unit, and Dr. J. G. Fred Hiss, also a lieutenant colonel, is assistant director.

The unit is made up of specialists in various branches of medicine and surgery. Serving as majors are Drs. Gerald C. Cooney, Arthur N. Curtiss, Ernest J. Delmonico, Lawrence W. Ehegartner, Leo E. Gibson, Morris J. Lavine, Earl E. Mack, Roscoe D. Severance, R. H. Thomasmeyer, dental surgeon, and Dr. James R. Wilson. Captains are Drs. Robert D. Fairchild, James D. Norris, and John van Duvn.

Members of the unit are commissioned in the re-

serve of the U.S. Public Health Service.

The College of Medicine's first hospital unit, the 52d General Hospital, has been on overseas duty since January, 1943.\*

### **Oueens County**

A new protein acid which is said to be proving almost as valuable as blood plasma in prolonged disease and shock cases was described by Dr. Nicholas D. Tiscione, of Jamaica, at the monthly meeting of the Queens County Medical Society held on April 25.

Dr. Tiscione told his audience of 150 physicians that the new acid, though not interchangeable with blood plasma, is less expensive and, given the time

and facilities, may be used in its place.

Medical officers of the St. Albans Naval Hospital were guests at the meeting. They heard, in addition to Dr. Tiscione's address, talks on professional subjects by Dr. Morris S. Bender, of Jamaica, and Dr. Herbert C. Maier, of Manhattan. Dr. W. Guernsey Frey, Jr., of Forest Hills, president of the society, led the professional subjects which followed a discussion which were discussion which will be discussed as the discussion which will be discussed as the discussion which w led the evening discussion, which followed a dinner in the society building.\*

### Steuben County

The medical profession must prepare to deal with new infectious diseases brought back to America by servicemen returning from overseas, Dr. Stockton Kimball, of Buffalo, said on April 13 at the quarterly luncheon meeting of the Steuben County Medical Society.

Speaking on the topic "Malaria, the Dysenteries,

and Filariasis," the physician described the types of tropical diseases and their symptoms.

Dr. Kimball is a member of the faculty of the University of Buffalo and the staff of the Buffalo General Hospital. He has studied tropical diseases in Latin American countries.

Dr. E. H. Ober, of Painted Post, president of the society, presided and introduced Dr. Kimball.

The group discussed the Steuben County medical manual for the care of welfare cases. The society will cooperate in this project with County Welfare Commissioner Charles G. Burnett of Bath. Dr. Ober said.\*

# Warren County

Dr. Wallace Finne MacNaughton, of Fort Edward, has opened a Glens Falls office where he will maintain office hours and make appointments.

### Westchester County

The regular meeting of the county society was held at the Westchester Division of the New York Hospital, in White Plains, on May 16 at 8:30 P.M.

Dr. Joe Vincent Meigs, of Boston, spoke on "Earlier Diagnosis of Uterine Cancer."

A special feature was the second presentation of the James Ewing Award.

Westchester physicians have mobilized their services through the mental health committee of the Westchester Medical Society, to provide consulta-tion and treatment for discharged war veterans suf-fering from neuropsychiatric disability, and for selective service registrants rejected because of nervous disorders.

The society announced that it has organized a group of specialists in the psychiatric field, who have volunteered to consult with and treat veterans referred by the home service division of the Red Cross, and rejected selectees referred by draft boards.

Details of the plan have been worked out with the Westchester Red Cross Chapter and draft boards are to be informed of the program, initiated by Dr. Clarence O. Cheney, medical director of New York Hospital, Westchester Division, and chairman of the subcommittee on mental health of the society's public health committee.\*

# Doctor, have you ever suffered from THROAT IRRITATION due to smoking?

So MANY DOCTORS, skeptical even in the face of thoroughly authenticated studies, have been convinced of Philip Morris' superiority by their own *personal* experience.

When your own throat irritation, due to smoking, clears up on changing to Philip Morris . . . when your own "smoker's cough" disappears, you are naturally more receptive to similar findings of other medical authorities, i.e., . . .

When smokers changed to PHILIP MORRIS, substantially every case of throat irritation due to smoking cleared completely or definitely improved.

Philip Morris & Company, Ltd., Inc., 119 Fifth Avenue, New York

# Hospital News

# Hospital Group Plans October Convention

THE third war conference and the forty-sixth annual convention of the American Hospital Association will be staged October 2 to 6, inclusive, in Cleveland, Ohio, city of its founding in 1899.

Convention headquarters will be at the Statler Hotel, Cleveland, with exhibits arranged in the city's auditorium, where general sessions of the con-

vention will be conducted. Allied organizations meeting simultaneously will assemble at the Hotel Cleveland.

Adequate hotel accommodations to meet the demands of a normal convention crowd will be available, George Bugbee, Chicago, executive secretary of the association, announced.

# Civilian Hospitals' Aid Needed for War Veterans

ESPITE the great development of Army and Navy facilities throughout the country, hospitalization of war veterans will require the assistance of civilian hospitals, according to a statement by Dr. Donald C. Smelzer, Philadelphia, presidentelect of the American Hospital Association.

"There is and will be a dearth of hospital beds for the care of veterans," Dr. Smelzer said in discussing plans for this year's observance of National Hospital Day, May 12, to pay tribute to Florence Nightingale, celebrated nurse who did so much in the

Crimean war to relieve the sufferings of soldiers.
"While the Federal Government will pay the entire cost of services to war-disabled civilians, the amended Rehabilitation Act proposes utilization of existing hospital facilities financed by a Federal-

State matching plan for the physical rehabilitation of all civilians who are disabled by injury or disease and whose condition is static," Dr. Smelzer said. "There are said to be two million civilians awaiting rehabilitation," he said. "It is hoped," he added, "the said." "that every hospital will do all in its power to make available every possible bed, if and when asked to do so by the Veterans' Bureau."

"The obstacles of personnel shortages, rationing, and material allocation are being overcome by hospital administrators," Dr. Smelzer said, "in their attempt to continue to have available for the American public the best in hospital care. Overseas and in each community all components of the American hospital system are performing their tasks in a manner of which we may all be proud."

# New Nurse Unit for Military Hospitals

THE War Department announced on May 3 that full-time employment in military hospitals throughout the nation of certified graduates of volunteer nurse's aides classes sponsored by the American Red Cross has been authorized by Maj. Gen. Norman T. Kirk, Surgeon General, U.S.A. With uniforms and insignia of their own, this new

group will be known as Army Nurses' Aides. To qualify for appointment as such an aide, the applicant must have been certified as having done one hundred and fifty hours in the accredited American

Red Cross classes. It also is necessary to have indefinite leave of absence from the Volunteer Nurse's Aide Corps of the American Red Cross.

"The addition of these trained eivilian employees will help the over-all nursing situation," declared Col. Florence A. Blanchfield, superintendent of the Army Nurse Corps. "By assigning a quota of these aides to an officer of the Army Nurse Corps, we can be assured of competent care for our hospitalized soldiers without draining too many trained personnel from private institutions," she said.

Canning of vegetables and fruits at the county

home in Onondaga Hill was started six or seven years ago on a modest scale but of late years the project has provided these edibles for the home, the sanatorium, and the county penitentiary. All

vegetables are grown on the farms at the home. The work has been performed under difficulties, with much of it being done outdoors during the

height of thecanning season.\*

# Improvements

Dutchess County has a new Blood Bank which is located at Vassar Brothers Hospital in Poughkeep-sie and is directed by Dr. J. Spottiswood Taylor, pathologist at the Hospital. The blood and plasma are available for patients throughout the county.\*

Completion of decorating work on the third-floor, west wing, of University Hospital in Syracuse late in April made available to the community the latest type of x-ray equipment, and brought the hospital's x-ray facilities up to three rooms and a portable unit.

The new unit, a Picker 200-milliampere x-ray machine, was installed April 1.\*

According to the Syracuse Post-Standard of April 24, construction of a new cannery at the Onondaga County Hospital and farm has been started and enough materials have been obtained to assure its

completion in a few weeks.

A gift of \$10,000 to provide a modern operating room with complete new equipment and up-to-date accessories at the Ossining Hospital has been announced by Dr. Charles C. Sweet, chairman of a committee appointed to secure the funds for the room. The entire gift will be presented to the hospital

and to the community by Mrs. Lester Hotheimer, of Ossining, in memory of her son, Lester Hotheimer, Jr., Army lieutenant, who was killed in action last year while serving with the armed forces.\*

board of the Mount Sinai Hospital and consulting otologist to the Hospital, a portrait of Dr. Friesner was presented on April 27 to the Board of Trustees for the permanent collection of the Hospital. The portrait, painted by Alpheaus P. Cole, was accepted for Mount Sinai by Waldemar Kops, acting president.

The portrait has been commissioned as a tribute to Dr. Friesner's twenty-four years of service as physician and teacher at the Mount Sinai Hospital, and to his pioneering work in establishing the relation of

otology to general medicine.

Last month their first shipments of penicillin were received by sixty-one hospitals in New York City designated as distributors under the new system of allocation to civilians.

Distribution, hitherto limited almost wholly to the armed services, is handled through the Office of Penicillin Distribution in Chicago, of which Dr.

John N. McDonnell is director.\*

In commemoration of the first anniversary of the arrival of the Mount Sinai Hospital unit in North Africa, on May 8 Waldemar Kops, acting president of the Hospital, cabled congratulations to the Commanding Officer of the Unit in the name of Mount Sinai's trustees and medical staff. Noting the completion of the first year of service abroad, the cable closes with the words: "We are proud of Mount Sinai overseas and the fine work you are doing."

Organized in 1940 and called to active duty in Sontal Mount Sinai overseas and the fine work you are doing."

Organized in 1940 and called to active duty in September, 1942, the Unit started its foreign duties in May, 1943. Lt. Col. Herman Lande is its Executive Officer and Maj. Ruth Chamberlain is Chief

winge"

Acceleration of enrollments in Associated Hospital Service, New York's Blue Cross Plan, continued in the first quarter of 1944, according to Louis H. Pink, president. Net increase for the period was 86,250 new members, almost 75 per cent of the yearly total of 113,424 reported for 1943. In the seventeen counties of lower New York State served by the plan, 1,528,801 persons are now protected by Blue Cross membership.

New York's was the second largest increase reported by all Blue Cross Plans in a quarter which set a new record also for total increase in the United States and Canada. The largest increase occurred in the Massachusetts plan, which is state-wide.

The public was asked on May 9 by Dr. Edward N. Bernecker, New York City's Commissioner of Hospitals, to contribute old radios and radio parts for use in the occupational therapy departments of the city hospitals. The Civilian Defense Volunteer Office will receive all contributions at its branch and local offices in the five boroughs.\*

# PENICILLIN IN PERU

Dr. Telemaco Battistini, director of the Peruvian National Institute of Hygiene, says that Peru was the first Latin American country to produce and use penicillin. The Peruvian scientist adds that the first experiments with penicillin were made at the Institute in August, 1942, and that by March, 1943, penicillin produced in Peru was being used in all the chief hospitals of Lima.—Release from the Office of the Coordinator of Inter-American Affairs

The torments of itching, burning eyes, blurred vision, uncontrollable sneezing and other ocular and nasal symptoms of hay fever usually respond quickly to the application of ESTIVIN.

One drop of Estivin in each eye, two or three times daily is generally sufficient to keep the average patient comfortable during the entire season. In more severe cases, additional applications whenever the symptoms recur will assure freedom from discomfort throughout the day.

# At the Helm

Dr. Thomas Bruce Hart Anderson has assumed his duties as senior medical officer in charge of the U.S. Marine Hospital, Clifton, succeeding Dr. William Y. Hollingsworth, who was transferred earlier this month to the directorship of the Marine Hospital in New Orleans.

Dr. Anderson arrived on Staten Island from Seattle, Washington, where he had been in charge of that city's Marine Hospital for two years.\*

Dr. Willard H. Veeder, for thirty-eight years a member of the Rochester State Hospital staff, took up his new job as superintendent of Craig Colony for Epileptics at Sonyea on May 1 as the third superintendent of the fifty-year-old institution.

Dr. Veeder is a former president of the Medical Society of the County of Monroe and vice-president

of the Academy of Medicine.\*

# Newsy Notes

The following paragraphs are quoted from the

New York Herald Tribune of April 16:

"At Christopher Street in the heart of Greenwich Village, Waverly Place splits to embrace two sides of a triangular four-storied building erected 117 years ago, one of the oldest structures in the city still housing its original tenant, the Northern Dis-pensary of the City of New York. "Founded in 1827 to provide medical and surgical

relief to the worthy poor, this institution's doors

have not been closed for 117 years.

"In a tiny three-sided room on the ground floor prescriptions are filled from jars and bottles that would please the eyes of dealers in antique china and glass. All medicines are sold at cost. . . .

"From the beginning the dispensary has been supported entirely by contributions, except for \$500 received annually from the city. In 1838, however, the Common Council, perhaps overzealous in its effort to balance the city budget, voted to discontinue the allotment on the ground it no longer was needed. Diligent effort by the trustees and the public recognition of the splendid work accomplished resulted in two years in the city's restoring he annual allotment and increasing it to \$1,000. The balance sheets through the years show that this amount never has varied...

"The dispensary has served through five wars, and again the government has made demands upon staff members and the voluntary workers so that there is need for help with the clerical work as well as cash gifts to keep the organization functioning. . . '

An exhibition of stamps depicting nurses, hospitals, doctors, and medical scientists, loaned by four physician-philatelists, was held at Gimbel's Stamp Department in New York from May 8 through May 15, in honor of National Hospital Day, May 12. The four exhibitors were: Dr. Anna R. Young of

Bridgeport, Connecticut, Dr. Louis A. Sarrow, Far Rockaway, New York, Dr. J. C. Horan, New York City, and Dr. Otho C. Hudson, Hempstead, New

York.

The display, which filled a dozen large frames on Gimbel's ground floor, was arranged by the stamp department to cooperate with the city, state, and national hospital associations. It was suggested by John H. Olsen, chairman of the National Hospital Day committees of the Hospital Association of New York State, the Greater New York Hospital Association, and the Hospital Council of Brooklyn.

Mr. Olsen believes that such stamp exhibits, which he has been promoting throughout the country, will emphasize the worthiness of the proposal that the United States issue a stamp to honor

the nursing profession which has attained such great wartime importance.

In his will the late Daniel B. Freedman of Brant Lake and New York City bequeathed property in Warren County to the Montefiore Hospital for Chronic Diseases, New York.

'Announcement has been received that the Hospital for Joint Diseases in New York City invites the admission of patients with acute and chronic osteomyelitis for treatment with penicillin.

The Admitting Office of the Hospital will arrange for the admission of such patients. The telephone number is LEhigh 4-5500.

The Hospital for Joint Diseases in New York City will make house staff appointments to fill twelve places on the general rotating service-four interns to begin service on October 1, 1944, and eight to begin July 1, 1945. One-half of the number appointed may be per-

mitted to continue for another nine months as junior residents, and thereafter one-half of the number of junior residents may be continued for another nine months as senior residents, in accordance with the Allocation Plan of the Procurement and Assignment Service.

The Woman's Hospital in New York City announced that coincidentally with the eighty-ninth anniversary of its founding, on May 4, 1855, the

40,000th baby had been born there.

Since its founding in 1855, when a small group of charitably inclined women met in a parlor on lower Madison Avenue to plan for a modest hospital of forty beds which would care exclusively for women, the Woman's Hospital has grown to an institution of 300 beds and has cared for over half a million women," an announcement by the hospital said.
"The year 1943 marked the peak in births—2,212 babies—since maternity patients were first admitted in 1910. A great many of these babies were the children of service men now in the armed forces here and abroad."\*

In commemoration of the seventieth birthday of Dr. Isidore Friesner, former president of the medical

# Haiti Carrying Out Extensive Malaria Control Work

Haiti-site of wartime rubber and fiber-growing operations-has drained malaria swamps around six coastal communities with a combined population of 200,000 under the inter-American health and

sanitation program.

Also 20,000 people have been treated for yaws, tropical skin and blood disease, with 15,000 to 20,-000 additional treatments being given weekly.

These developments were reported by Ralph S. Howard, Jr., chief of the United States health commission to to Haiti, on his arrival in Washington to confer with officials of the health and sanitation division of the Office of the Coordinator of Inter-American Affairs.

Under the program Haiti and seventeen other American republics are cooperating with United States assistance to raise hemisphere health standards, especially in areas of strategic production and

Mr. Howard said malaria has been reduced to a secondary health problem in Port-au-Prince, Haiti's

capital.
"This was accomplished largely through instalnate mosquito breeding swamps, including considerable work around the airport," he said.
"In view of the city's importance as a terminal of

inter-American air lines, and as a seaport at the strategic Caribbean gateway to the Panama Canal, the malaria control work has value as a contribution to international quarantine.

The rest of the malaria control work involved installation of fifteen miles of drainage ditches and canals in and around the towns of Petit Goave, Aux Cayes, Cap Haitien, Port de Paix, and Mole St. Nicholas. These projects, as well as four yaws clinics established, are largely in communities from which workers are drawn for rubber and fiber plantations."

Mr. Howard reported that Haiti has seventeen specialists making public health studies under the training phases of the inter-American program.

"Such training looks to the long range in anticipation of the need in Haiti for additional technicians as the result of the impetus given health work through inter-American collaboration." he said. "Seven of the men are studying at Harvard University and ten at the School of Tropical Medicine in San Juan, Puerto Rico."

The mission headed by Mr. Howard, a sanitary engineer, is giving technical assistance to Haiti.-Release from of the Office of the Coordinator of Inter-

American Affairs

# Inhalants for Influenza Undesirable

Use of inhalations of finely atomized specific antiserum for the prevention and treatment of influenza is not now desirable, the Journal of the American Medical Association for last December 18 warns. The Journal says that it has been reported that serious reactions and death have occurred among animals being tested with such a procedure and that further human studies should be pursued with great caution.

# Secretary Perkins Sets Goal for Accident Rate Reduction

A million fewer industrial injuries in 1944 was the goal set by Secretary of Labor Frances Perkins before a recent meeting of the Department of Labor's National Committee for the Conservation of Manpower in War Industries. Its achievement, she pointed out, would amount to about a 40 per cent reduction from the 1943 total of nearly 2,500,000

injuries.
"This reduction would result in the saving of some 22,000,000 days of work," Miss Perkins said. "In manufacturing alone it would increase the number of workers on the job each day by 24,000. Many nonmanufacturing establishments are, of course, directly engaged in war work, and a curtailment of injuries in them would be of direct benefit to the war effort. Fewer injuries to persons employed in operations not directly connected with the war would do much to maintain an adequate supply of labor for

war production.
"While the goal of an over-all 40 per cent reduction may seem unduly high to some, there is no doubt that it can be accomplished in a large number of individual establishments. The work of the Department's National Committee has produced many instances of accident reduction in excess of 40 per

"The size of the accident-prevention task will make it necessary for the Department to confine its own program to manufacturing establishments engaged directly on war contracts. Nevertheless, the Department has a definite interest in the safety of wage earners in every type of work. The establish-ment of an accident reduction goal covering every type of employment will do much to stimulate the active interest of employers and workers, and assist other groups, both governmental and private, now working directly in those fields on the matter of safety."-Release from the Office of War Information

# Inadequate Diets and Nutritional Deficiencies in the United States

An ap-preciable percentage of diets fail to meet more than 50 per cent of the recommended daily allowances of the Food and Nutrition Board, but many more diets are deficient by less than 50 per cent. This wide-spread prevalence of more or less deficient diets is associated with a high incidence of deficiency states, largely mild in intensity and gradual in their course. The problem thus created is both preventive and

For prevention, production of sufficient food must be maintained and better distribution is required; judicious enrichment of appropriate foods may be advisable, and dietary education should be intensified and extended. For correction there is need for skill in detecting deficiency conditions and improved procedure for the treatment of such conditions. There has been some exaggeration of the benefits of optimal nutrition and much exploitation of the vitamins. This has retarded the proper application

of the science of nutrition. However, knowledge of the relation of nutrition to health is being rapidly uncovered. The evidence now available, incomplete though it may be, leads to but one conclusion: that "there is a real difference as measured in terms of growth development and general health record between optimum and just adequate nutrition; and that every practical effort should be made to apply this knowledge in the interest of human welfare."—

J.A.M.A., April 16, 1944

# Leukemia in Physicians

Leukemia may occur in workers with radiation under conditions like those in which carcinoma of the skin due to radiation can arise. Exposure to x-rays under experimental conditions favors the development of leukemia in animals. Since high energy radiations may play a part in human leukemia, workers in the National Cancer Institute have compared the incidence of leukemia in physicians and in the general population on the basis of the death lists of physicians in the Journal, the mortality reports of the United States Bureau of the Census, and an unpublished compilation of the United States Public Health Service. The ratio of deaths from leukemia to deaths from cancer, the ratio of deaths from leukemia to total death rates, and death rates from leukemia were studied with the result that leukemia "was recognized approximately 1.7 times more frequently among physicians than among white males in the general population." The result is in accord with the increase in the incidence of leukemia in animals exposed to x-rays. Whatever the full meaning of the data at hand may be, the hazards of radiation require the strict maintenance of complete protection at all times. - J.A.M.A., April 15, 1944

# Early Record of Vitamin C Deficiency

Perhaps the earliest recorded example of vitamin C deficiency was that described in himself by Luigi Cornaro in 1558. According to Marcovitch, Cornaro restricted his diet to bread, the yolk of egg, and a little meat, together with 14 ounces of wine. During July and August of each year he suffered from anorexia, but as soon as new wine became available his symptoms improved. In the light of modern knowledge this may be interpreted as evidence of vitamin C deficiency, since it is now known that wine, never overplentifully supplied with this vitamin, contains none at all after it becomes a year old. During periods of vitamin C deficiency, Cornaro frequently ate only the yolk of an egg; since carbohydrates create a demand for vitamin C that is not made by proteins or fats, he thus showed himself to be a keen observer and an astute selector of suitable food.—J.A.M.A., March 18, 1944

# Change in Dates of Annual Conference

The Annual Conference of Health Officers and Public Health Nurses will be held in Saratoga Springs beginning June 27, instead of June 20 as previously announced.

# Articles on "Health and War"

A series of five articles on the general theme "Health and War" have been prepared by the State

Department of Health for use by the Office of Civilian Mobilization of the New York State War Council. These papers are being distributed to city and county war councils with the recommendation that they be presented before service organizations, women's clubs, professional associations, and other interested groups. Each one is prefaced by a short introduction designed to stimulate questions and discussion. It is suggested that one paper be read at each group meeting until the entire series is covered. The subjects are: "Accidents and the War"; "Tuberculosis in Wartime"; "Communicable Diseases of Special Importance in Wartime"; "Emergency Maternity and Infant Care Program"; and "Venereal Disease as Affected by War Conditions."

Organizations interested in procuring these articles should communicate with the Office of Civilian Mobilization of the New York State War Council, 353 Broadway, Albany, New York.—Health News, May 8, 1944

# Expectation of Life

The League of Nations Monthly Bulletin for last December presents data on the expectation of life at birth and at 1 year of age in over thirty countries. For all countries covered the expectation of life at birth and in the earlier years of life is greater than in previous periods; the improvement is less striking or absent in later stages of life.

The United States ranks high in the list and is exceeded only slightly by the Netherlands, New Zealand, Australia, and Sweden. Japan, Russia, and India have the lowest expectation of life, according to the latest information available. In all countries females show a greater expectation of life than males.—J.A.M.A., March 18, 1944

# Tuberculosis Treatment in Manitoba

Since November 1, 1942, no resident of Winnipeg, Manitoba, has had to pay for tuberculosis treatment. In adopting this policy the City Council was influenced by the desirability of segregating all potential sources of infection, the fact that the cost of treating tuberculosis is ruinous to the average family, and that financial pressure frequently interferes with the patients' chances of recovery. Another factor was the difficulty experienced in securing payment of hospital bills—Bulletin, Canadian Tuberculosis Association, March, 1943

# Cycles in Tuberculosis

Tuberculosis moves so slowly that we measure its progress against a man's life. Public health men have begun to talk of family epidemics, taking two or three generations to run their course, but a longer perspective may be needed to reveal the play of major cycles.—Geddes Smith in Plague on Us, Commonwealth Fund, 1941

# Logic in Treatment of Tuberculosis

If the fire departments were to refuse to fight fires started by eigarettes not made in the home county, they would be no more ridiculous than are we when we refuse to fight tuberculosis in a person who has not lived long enough in one spot to establish legal residence.—T. J. Werle, in Health, May-June, 1941

# ANNOUNCEMENT

A NEW SERVICE ...

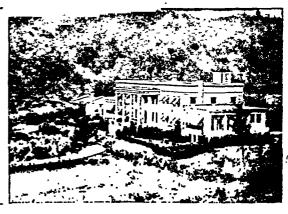

In Hediger Hall, on the scenic Michell Farm grounds, we now have accommodations for a limited number of elderly ladies needing some supervision and medical care in a homelike atmosphere.

POOR BUTCHERS—"It may not be generally known that in many states it is a violation of the law, or a long-observed court custom, for butchers to serve on murder juries," remarks a vegetarian. "The reason for this disqualification of butchers

is quite obvious: of course their business tends to make them cruel, callous to suffering, and bluntly indifferent to all the finer sensibilities, including justice and mercy." Now you know why you can't wheedle your butcher out of a T-bone steak.

# THE MAPLES INC., OCEANSIDE, L. I.

A sanitarium especially for invalids, convalescents, chronic patients, post-operative, special diets, and body building. Six acres of landscape lawns. Five buildings (two devoted exclusively to private rooms). Resident Physician. Rates S21 to S50 Weekly.

### REVIEWEL

Gastro-Enterology. By Henry L. Bockus, M.D. Volume II. The Small and Large Intestine and Peritoneum. Three volumes to be published Quarto of 975 pages, illustrated. Philadelphia, W. B. Saunders Co., 1944. Cloth. Price of set, \$35.

The second volume of this monumental work covering diseases of the small and large intestine and peritoneum continues the excellent tradition established by Volume I. Again the discussion on applied anatomy and physiology is of outstanding value. The arrangement of the text makes it easy for the reader to get a general picture of each disease from the paragraph heading and to go into the details of any particular phase by reading the entire paragraph. The writer and his colleagues write entertainingly, usually in the first person, quoting actual cases from their large experience as they discuss each condition. The style alone makes it difficult to stop reading, and the placing of the

bibliography at the end of each chapter simplifies reference reading. This encyclopedic clinical work will long be remembered as one of the most important contributions to modern medicine.

A. F. R. ANDRESEN

The Mechanics of Obstetrics. By Norris W Vaux, M.D., and Mario A. Castallo, M.D. Octavo of 217 pages, illustrated. Philadelphia, F. A. Davis Co., 1943. Cloth, \$4.00.

This manual of mannequin obstetrics is used in teaching the subject during the junior year at the Jefferson Medical College. The volume is an outgrowth of loose-leaf notes and, later, bound mimeographed sets of notes used by Dr. Vaux and Dr. Montgomery in teaching the course.

The female pelvis in its normal and abnormal variations is clearly described, and the mechanism of labor in the various fetal presentations is set forth

in detail. The text is clear, concise, well arranged, and wonderfully illustrated. This book is valuable not only for teaching students but also for those who are taking refresher courses.

WILLIAM SIDNEY SMITH

Textbook of Medicine. By various authors. Edited by J. J. Conybeare, D. M. Oxon. Sixth edition. Octayo of 1,147 pages. Baltimore, Williams & Wilkins Co., 1942.

Of the minor textbooks of medicine, Conybeare's is probably the best known. Now in its sixth edition (October, 1942), it has been carefully brought up to date by a staff of eighteen contributors, with two or three exceptions, all of London.

All of the articles are concise but not cramped, and essential material is adequately presented. Pathology has not been slighted. One does not look for historic data, and references to the literature are

purposely omitted.

The volume is well printed, well arranged, and enriched with sections on neurology, psychologic medicine, and common diseases of the skin. It fits the hand (3½ pounds) and will be welcomed and consulted by many doctors.

FRANK BETHEL CROSS

Medical Leaves: A Review of the Jewish Medical World and Medical History. Volume V. Dr. Hershel Meyer (Ed.). Quarto of 190 pages, illustrated. Chicago, Medical Leaves, Inc., 1943.

This is the fifth volume of a series of publications, each of which represents a symposium on medical history. There is invaluable information available to those interested in medical history, and this volume, like its predecessors, does much to indicate the part played by Jews in medicine, in scientific and cultural accomplishments.

A. M. RABINER

Experimental Surgery. A Laboratory Guide for Undergraduate Students. By J. M. McCaughan, M. D. Quarto of 80 pages, illustrated. St. Louis, C. V. Mosby Co., 1943. Paper, \$2.00.

This loose-leaf book containing eighteen different exercises for experimental surgery on animals is, of course, essentially for the undergraduate student. However, the simplified technics, which are well illustrated, could be used by the graduate student who is interested in working out some of his own ideas, provided he has access to the material.

The technic of operating upon animals is very similar to that used in operating upon human beings. However, the care of the animal before operation and after operation is a little different, and the reaction of the various physiologic constants is also somewhat different. At the end of each exercise are a number of questions to be answered with an operative sheet somewhat similar to that used in all operating rooms. There is also a good list of references about the particular exercise that has been performed.

This guide fulfills the purpose for which it has been written.

HERBERT T. WIKLE

Peripheral Vascular Diseases (Angiology). By Saul S. Samuels, M.D. Octavo of 84 pages. New York, Oxford University Press, 1943. Cloth, \$2.00

This short text is devoted entirely to an outline of peripheral vascular diseases. It covers the commoner diseases of arteries, veins, and lymphatics, and has two chapters on the anatomy of vessels and their nerve supply. Each chapter is followed by a short but comprehensive bibliography.

HENRY W. LLOYD, M.D., Physician in Charge Telephone: Kingsbridge 9-8440

[Continued from page 1275]

Under the caption of "Treatment" conservative measures are stressed throughout. A few of the methods recommended are controversial, but how could it be otherwise in such an extensive field?

The book is valuable as a ready reference for the student, the practitioner, or the specialist. Each reader may profit in his own way from its contents.

ROBERT F. BARBER

The Hospital in Modern Society. Edited by Arthur C. Bachmeyer, M.D., and Gerhard Hartman, Ph.D., Octavo of 768 pages. New York, Commonwealth Fund, 1943. Cloth, 85.00.

To the desk of the hospital administrator come many periodicals, often containing articles of lasting value to himself and more particularly for the training of his departmental executives. When it is current, information in this form is acceptable, but as reference material it soon becomes almost inaccessible. The Hospital in Modern Society, representing ninety-eight authors, is a compilation of just such data and covers practically all problems in the administration of hospitals. A most valuable feature is the suggested reference reading.

W. G. NEALLEY

Experimental Biochemistry. By George D. Wessinger, M.S., Ph.D. Octavo of 108 pages, illustrated. St. Louis, C. V. Mosby Co., 1943. Paper, \$1.50.

The title of this volume is somewhat misleading. It is really not a book on experimental biochemistry, but is a manual of experiments in biochemistry. It presents briefly and concisely the steps to be followed in biochemical tests. It is fragmentary and incomplete. Planned for dental students, it appears to serve its purpose adequately.

WILLIAM S. COLLENS

Medical Radiographic Technic. Prepared by the Technical Service Department of General Electric X-Ray Corporation under the editorial supervision of Glenn W. Files, Director. Quarto of 365 pages, illustrated. Springfield, Ill., Charles C Thomas, 1943. Cloth, \$6.00.

Various books have been published on x-ray technic, but no others are so copiously illustrated and so descriptive. This book has been developed from the experience of the expert technicians of the General Electric Corporation, with original practical photographs revealing proper positioning and technic. The illustrations of the properly positioned parts are unusually excellent, and the angle of projection required, together with the focal point, is additionally portrayed by means of a mirrored image, so that one carefully following directions cannot but markedly improve his results.

The theory and physics of the x-ray are simply and well described and the factors affecting the quality of the radiographs are thoroughly explained. Stereoscopic projection, laminography, and foreign-body localization are included, as well as the modern technic of photographing the fluoroscopic image which is now so frequently employed for chest

study in the armed services.

The book is written essentially for the x-ray technician, for which reason a chapter is, with good judgment, devoted to human anatomy, without a knowledge of which no technician worthy of the name can operate.

It is a "must" book for those interested in the specialty, and is as important to the radiologist as to his lay assistant.

MILTON G. WASCH

The Mind of the Injured Man. By Joseph L. Fetterman, M.D. Octavo of 260 pages, illustrated. Chicago, Industrial Medicine Book Co., 1943. Cloth, \$4.00.

This is an unusually well-written book on a subject that has always been associated with much controversy. The question of the influence of trauma on the nervous system is handled in a versatile way, and matters that have occurred in the routine practice of every physician are discussed and evaluated.

The reviewer has enjoyed reading this book and is certain that others will benefit by doing so.

A. M. RABINER

A Manual of Cardiology. By Thomas J. Dry. Duodecimo of 310 pages, illustrated. Philadelphia, W. B. Saunders Co., 1943. Cloth, \$3.00.

This well-written, well-printed manual is adequate in every way. Simplified methods of diagnosis are presented and contentious discussions are omitted. Pathology, murmurs, and the mode of their production are coordinated with all collateral evidence, and thus concepts are rendered clear, to the reader's profit.

Electrocardiographic phases and radiographic studies are well presented. Conspicuously absent is the American Heart Association's classification of heart disease. The omission should be corrected in a second edition, which the volume well deserves.

FRANK BETHEL CROSS

Elements of Medical Mycology. By Jacob Hyams Swartz, M.D. Octavo of 179 pages, illustrated. New York, Grune & Stratton, 1943. Cloth, \$4.50.

This book is an excellent treatise on medical mycology. It covers in detail the morphology and cultural characteristics, together with the definite

diagnoses, of the various types of fungi.

It is all summed up in a table, at the back of the book, which gives the clinical picture and mycologic findings of most, if not all, of the pathogenic fungi of the skin. The book is printed in a clear manner

with excellent illustrations.

Altogether, it is to be highly recommended.

JOHN C. GRAHAM

Pain. (Res. Publ. Ass. Nerv. Ment. Dis., Vol. 23.) Editorial Board, Harold G. Wolff, M.D., Chairman. Octavo of 468 pages, illustrated. Baltimore, Williams & Wilkins Co., 1943. Cloth, \$7.50.

The thirty-two contributions in this volume and the excellent discussions on them should be read by everyone interested in the subject of pain, whether it be from a physiologic, anatomic, or diagnostic angle. They deal with the pain in connection with peripheral nerves, cerebral cortex, muscles, skin, headache, nose, eye, joints, urinary tract, bronchi, lungs, digestive tract, and heart. It is unfortunate that there are no papers dealing with the use of this knowledge of pain in the differential diagnosis of diseases of the different viscers.

M. A. Rabinowitz

The Arthropathies. A Handbook of Roentgen Diagnosis. By Col. Alfred A. de Lorimier, M.D., (MC), USA, Commandant, the Army School of Roentgenology, Memphis, Tenn. Octavo of 319 pages, illustrated. Chicago, Year Book Publishers, Inc., 1944. Cloth, \$5.50.

This is a handbook compiled from a series of lectures delivered at the Army Medical School, Washington, D.C., and the Army School of Roentgenology, Memphis, Tennessee, describing and lavishly illustrating the various afflictions of the joints.

The subject is didactically treated in extremely simple language, and is presented in two partsone on peripheral joints and the other on the spine. Eighty-five pages are given to the latter. Since there is still much knowledge of this portion of the skeleton to be gained, the space allotted is well con-

The x-rays are thoroughly captioned, arrowed, and lettered, directing the reader to the essential findings. Unfortunately, the illustrations, probably collected over the years, lack the detail that modern rotating anode tubes now produce. Far outweighing this shortcoming, however, is the exhaustive bibliography following each chapter, so that one desirous of investigating a particular arthropathy need only refer to this book for its inherent knowledge and further guidance.

MILTON G. WASCH

Childbirth Without Fear. The Principles and Practice of Natural Childbirth. By Grantly Dick Read, M.D. Octavo of 259 pages. New York, Harper & Bros., 1944. Cloth, \$2.75.

This is a book written for the laity, who will, I think, not appreciate it, dedicated to the idea that childbirth should be painless. "Anesthesia," he says, "in natural childbirth is rarely desired by the woman, or justified, even on humane grounds." Walt Disney could hardly do justice to the 'Silly Symphony of Obstetric Analgesia."

Everyone who practices obstetrics should read this book. The specialist will be delighted with it,

and will learn a lot.

CHARLES A. GORDON

Office Treatment of the Nose, Throat and Ear. By Abraham R. Hollender, M.D. Octavo of 680 pages, illustrated. Chicago, Year Book Publishers, Inc., 1943. Cloth, \$5.00.

The very publication of a book of this type is definitely a step forward in the right direction in so far as office treatment and medical otolaryngology are concerned. The author attempts to evaluate the patient as a whole, bringing out the interrelationship of the ear, nose, and throat to the general body economy. The sincere and seasoned otolaryngologist is heartily in sympathy with the wide dissemination of a book of this type because of its scope and content. The general practitioner may well profit by the study of this book in order that he, too, may more adequately fulfill his obligation to the patient.

The author covers the entire field of otolaryngology in chapters and subdivisions which make for easy reading and ready reference. This work, therefore, acts not only as instructor but also as a reminder to the "Knights of the Scalpel," that pateints with otolaryngologic problems can also be relieved or cured by proper hygiene, adequate and well-balanced diets, and good habits, together with medical care and "office otolaryngology."

SUCROSE FOR LACTOSE-In order that more lactose may be available for penicillin production, the Committee on National Formulary, with the approval of the Council of A. Ph. Association, has authorized the use of sucrose in National Formulary preparations of which lactose is an ingredient. Except in connection with pepsin the sucrose must contain not less than 96.5% pure sucrose and not more than 3.2% of starch.

[Continued from page 1277]

Pathology and Therapy of Rheumatic Fever. By Leopold Lichtwitz, M.D. Octavo of 211 pages, illustrated. New York, Grune & Stratton, 1944. Cloth, \$4.75.

This is an especially well-written treatise on the pathology and therapy of rheumatic fever. author emphasizes the sensitization character of rheumatic disease and brings out in a clear way the high incidence of arthritis which is of rheumatic origin and which is so commonly overlooked because of the absence of heart findings.

His contribution on therapy is illuminating, and the importance of desensitization in treatment is emphasized. Dr. Lichtwitz looks disapprovingly upon

gold therapy.

HENRY M. FEINBLATT

Essentials of Dermatology. By Norman Tobias, M.D. Second edition. Duodecimo of 497 pages, illustrated. Philadelphia, J. B. Lippincott Co., 1944. Cloth, \$4.75.

In 1941, when this work of Dr. Tobias made its first appearance, it was our pleasant duty to review it. It is no wonder to us that a second edition has be-

come necessary. As a teacher of his subject, Dr. Tobias has kept abreast of the very latest thought. and this new edition reflects the thoroughness of his study and judgment. Much of the book has been rewritten and considerable new material added. The illustrations are not only well chosen but are the work of a master in photographic technic. Over forty pages are given to the subject of syphilis alone, and its diagnosis and treatment are brought thoroughly up to date. The pages on treatment are especially instructive and the directions so detailed and complete as to leave no chance for error.

The book is filled with many very practical and serviceable prescriptions, and special pages have been devoted to the use of the sulfonamide drugs in dermatology and a table of normal values. These pages have been added, no doubt, as a second thought, and are pasted in the covers for quick

reference.

Three years of personal use with the first edition of this handbook makes the purchase of its successor a pleasant necessity.

The publishers are to be congratulated on the format, the typography, and the general handy

NATHAN THOMAS BEERS

### CUSHING'S LIBRARY

ing no one was more deeply imbedded in his personality than his love of books. Beginning as a student, he built up a library of nearly eight thousand volumes, a collection he bequeathed to Yale University. Certain sections of the library, having particular interest on account of their size or completeness, were to be catalogued by his request. In order to give a complete idea of the whole library, however, the Historical Library of the Yale Medical Library has issued a short-title catalogue of all the books.

To those familiar with Cushing's taste in books, it is not surprising to find the incunabula section and the writings of Paracelsus, Paré, and Vesalius filling many shelves. Indeed, one hundred and sixty-eight medical incunabula, with sixty manuscripts, comprise a collection that any medical library would be proud to own. Hardly half a dozen collections of this magnitude exist in America. In addition, Cushing owned over forty editions of books by Paré, sixteen by Paracelsus, and more than fifty by Vesalius.

The last, the only group carefully worked over by Cushing, have recently been considered in a special study. Other authors, however, are also

Of the multiple interests of the late Harvey Cush- , well represented: Robert Boyle, sixty-one editions; Nicholas Culpeper, one hundred and ten; Daniel Drake, sixteen; Robert Fludd, nineteen; Samuel Garth, twenty-four; William Harvey, forty-three; Edward Jenner, thirty; Leonardo da Vinci, eight-cen; Carl von Linné, thirty-four; Silas Weir Mitchell, forty-three; William Salmon, twenty; Mitchell, forty-three; William Salmon, twenty; and Tobias George Smollett, seven. The longer lists might be supplemented by many important shorter ones, some containing even greater books from the pens of less prolific writers. His contemporaries-Osler, Klebs, Welch, Power, Sarton, Singer, and others—are naturally fully represented. Since the surgical texts and periodicals were removed from his library when Cushing left Boston in 1930, the books now catalogued represent those that he thought were worth saving, the result of years of collecting. If an individual library may be said to reflect the man, surely a portrait of Cushing stands out in the contents of this catalogue. Broad interest, complete details, sound universality but exact focal discrimination, and "looking all around a problem," to use one of his favorite expressions—in other words, the characteristics of Harvey Cushing—are well mirrored in his carefully selected library—New England J. M

### FIRST LISA AWARD

The Society of the Alumni of City (Charity) Hospital, in New York City, announces the presentation of the first James R. Lisa Award to Lt. Chauncey L. Royster, (MC), AUS. Lieutenant Royster received the award for his work on "The Cardiac Findings in Syphilis Combined with Hypertension, in the Absence of Aortic Regurgitation."

The Lisa Award was established by the Alumni Society of the City Hospital to recognize work in re-

search medicine done in the laboratories of the hospital under Dr. Lisa's direction, the award to be made by Dr. Lisa at appropriate times to the worker deemed by him to be worthy of it. The award consists of a medallion and an honorarium of several hundred dollars. Lieutenant Royster graduated at Cornell University Medical College in 1935 and served his internship and residency at the City Hospital.

[Continued from page 1277]

Pathology and Therapy of Rheumatic Fever. By Leopold Lichtwitz, M.D. Octavo of 211 pages, illustrated. New York, Grune & Stratton, 1944. Cloth, \$4.75.

This is an especially well-written treatise on the pathology and therapy of rheumatic fever. The author emphasizes the sensitization character of rheumatic disease and brings out in a clear way the high incidence of arthritis which is of rheumatic origin and which is so commonly overlooked because of the absence of heart findings.

His contribution on therapy is illuminating, and the importance of desensitization in treatment is emphasized. Dr. Lichtwitz looks disapprovingly upon

gold therapy.

HENRY M. FEINBLATT

Essentials of Dermatology. By Norman Tobias, M.D. Second edition. Duodecimo of 497 pages, illustrated. Philadelphia, J. B. Lippincott Co., 1944. Cloth, \$4.75.

In 1941, when this work of Dr. Tobias made its first appearance, it was our pleasant duty to review it. It is no wonder to us that a second edition has be-

come necessary. As a teacher of his subject, Dr. Tobias has kept abreast of the very latest thought, and this new edition reflects the thoroughness of his study and judgment. Much of the book has been rewritten and considerable new material added. The illustrations are not only well chosen but are the work of a master in photographic technic. Over forty pages are given to the subject of syphilis alone, and its diagnosis and treatment are brought thoroughly up to date. The pages on treatment are especially instructive and the directions so detailed and complete as to leave no chance for error.

The book is filled with many very practical and serviceable prescriptions, and special pages have been devoted to the use of the sulfonamide drugs in dermatology and a table of normal values. These pages have been added, no doubt, as a second thought, and are pasted in the covers for quick

reference.

Three years of personal use with the first edition of this handbook makes the purchase of its successor a pleasant necessity.

The publishers are to be congratulated on the format, the typography, and the general handy

getup.

NATHAN THOMAS BEERS

### CUSHING'S LIBRARY

of the multiple interests of the late Harvey Cushing no one was more deeply imbedded in his personality than his love of books. Beginning as a student, he built up a library of nearly eight thousand volumes, a collection he bequeathed to Yale University. Certain sections of the library, having particular interest on account of their size or completeness, were to be catalogued by his request. In order to give a complete idea of the whole library, however, the Historical Library of the Yale Medical Library has issued a short-title catalogue of all the books.

Well represented: Robert Boyle, sixty-one editions; Nicholas Culpeper, one hundred and ten; Daniel Drake, sixteen; Robert Fludd, nineteen; Samuel Garth, twenty-four; William Harvey, forty-three; Edward Jenner, thirty; Leonardo da Vinety, in Mitchell, forty-three; William Salmon, twenty; and Tobias George Smollett, seven. The longer lists might be supplemented by many important shorter ones, some containing even greater books from the books.

To those familiar with Cushing's taste in books, it is not surprising to find the incunabula section and the writings of Paracelsus, Paré, and Vesalius filling many shelves. Indeed, one hundred and sixty-eight medical incunabula, with sixty manuscripts, comprise a collection that any medical library would be proud to own. Hardly half a dozen collections of this magnitude exist in America. In addition, Cushing owned over forty editions of books by Paré, sixteen by Paracelsus, and more than fifty by Vesalius.

The last, the only group carefully worked over by Cushing, have recently been considered in a special study. Other authors, however, are also well represented: Robert Boyle, sixty-one editions; Nicholas Culpeper, one hundred and ten; Daniel Drake, sixteen; Robert Fludd, nineteen; Samuel Garth, twenty-four; William Harvey, forty-three; Edward Jenner, thirty; Leonardo da Vinci, eighteen; Carl von Linné, thirty-four; Silas Weir Mitchell, forty-three; William Salmon, twenty; and Tobias George Smollett, seven. The longer lists might be supplemented by many important shorter ones, some containing even greater books from the pens of less prolific writers. His contemporaries—Osler, Klebs, Welch, Power, Sarton, Singer, and others—are naturally fully represented. Since the surgical texts and periodicals were removed from his library when Cushing left Boston in 1930, the books now catalogued represent those that he thought were worth saving, the result of years of collecting. If an individual library may be said to reflect the man, surely a portrait of Cushing stands out in the contents of this catalogue. Broad interest, complete details, sound universality but exact focal discrimination, and "looking all around a problem," to use one of his favorite expressions—in other words, the characteristics of Harvey Cushing—are well mirrored in his carefully selected library —New England J. "Over Forty Years devoted to pleasing particular people"

The potentiation of the central action of phenobarbital by the belladonna alkaloids (Friedberg, Arch. f. exp. P. & P. CLX, 276) renders possible attainment of desired effects with relatively small doses, thus avoiding "hang over" and other unpleasant side-actions. In contrast to galenical preparations of belladonna, such as the tincture, Belbarb has always the same proportion of the alkaloids.

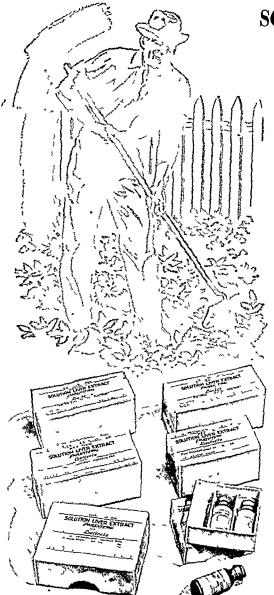

Indications: Neuroses, migraine, functional digestive and circulatory disturbances, vomiting of pregnancy, menopausal disturbances, hypertension, etc.

Formula: Each tablet contains 1/4 grain phenobarbital and the three chief alkaloids, equivalent approximately to 8 minims of tincture of belladonna.

Belburb No. 2 has the same alkaloidal content but ½ grain phenobarbital per tablet

# A step forward in Menopausal Therapy

Today we accept synthetic estrogens as a rational means of controlling the menopausal patient, forgetting the blind gropings of the therapists of only forty years ago.

The advent of modern endocrinology and biochemistry made possible the combination of the newest synthetic estrogen, hexestrol with the safe, universally accepted sedative; phenobarbital, thus formulating Hexital.

Hexital, in addition to providing more extensive control of symptoms, is effective in greatly reducing the incidence of undesirable side effects associated with synthetic estrogen therapy. Nausea is practically eliminated by this new stilbestrol derivative, plus a sedative.

Dosage: One tablet containing 3 mg. of hexestrol and 20 mg. of phenobarbital is the average close, preferably taken at bedtime. It is supplied in bottles of 100 scored tablets.

DONNATAL

YET IT IS ENTIRELY NON-NARCOTIC;

DONNATAL has

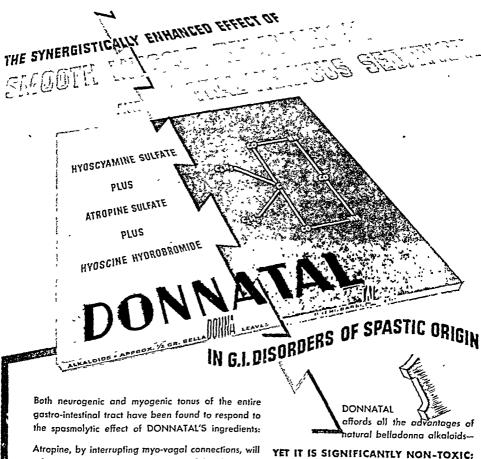

pharmacologic pote

COSTS

AND

des for the sedation

uently required-

Atropine, by interrupting myo-vagal connections, will relieve spasticity of the upper portion of the alimentary canal, thereby relaxing pylorospasm and tending to re-establish the normal type of gastric secretion. Scopolamine is noted for its sedation of the intestinal structures, and its consequent value in spastic constipation and irritated colon. A relaxing influence similar to that of atropine (though more marked) is exerted by hyoscyamine—upon smooth muscle of the G. I. tract, gallbladder and ureter, providing relief in gastric and hepato-biliary colic, and in sphincter spasm

Phenobarbital helps control the psychogenetic factor—so important in spastic pathologies—by sedation of the central nervous system, supported in certain cases by the central action of scapplamine.

Donnatal is available in bottles of 100 tablets, each tablet containing the formula illustrated above

HESODAT Brewer

The ORIGINAL ENTERIC-COATED TABLET OF THEOBROMINE SODIUM ACETATE

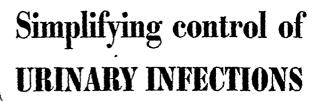

to control frequency and severity of attacks in CARDIOVASCULAR AND RENAL DISEASES and to prevent EDEMA

Clinical experience and studies have proven the value of Theobromine Sodium Acetate in certain Cardiovascular and Renal Diseases. In Angina Pectoris, used adequately, it permits more work by the individual without developing precordial pain or distress. As one of the most effective Xanthine Vasodilators it helps increase the available blood supply to the heart and kidneys to increase the efficiency of these organs. It has also been found an effective aid in treating and preventing Edema of Cardiac or Renal origin. The enteric coating (especially developed for Thesodate) permits larger doses without the drug's

contact with the Gastric Mucosa.

Mandelamine (methenamine mandelate), as a result of its chemical structure, promotes an intensified bactericidal action.

Mandelamine evidences effectiveness against a wide range of organisms common in urinary tract infection.

Mandelamine therapy, because of the comparatively small effective dosage, rarely produces the toxic reactions frequently observed with other urinary antiseptics.

Mandelamine administration usually does not require accessory acidification, routine pH control, or fluid or dietary restrictions.

## Camacton of clinical value

In ANGINA PECTORIS · ARTERIOSCLEROSIS · PERIPHERAL VASCULAR DISEASES

Carnacton is a biologically tested extract of highly vascularized and active diaphragmatic muscle with a high metabolic rate... providing dependable vasodilator and depressor benefits. Carnacton helps establish collateral circulation and promotes cardiovascular tone and vitality.

Ampuls of 1 cc. and 2 cc. boxes of 12 and 50; vials of 30 cc. for oral use. For detailed brochure address Dept. N.

CAVENDISH PHARMACEUTICAL CORP., 25 West Broadway, New York

## New BIOLAC still easy to calculate!

THE CHANGED, more highly concentrated Biolac still saves you valuable time. There are no extra ingredients to calculate, because it's a complete infant formula\*.

For standard formulas, simply dilute 1 fl. oz. of new Biolac with 1½ fl. ozs. water. Feed 2½ fl. ozs. of this formula daily for each pound of body weight.

### Why Biolac has been changed

To conserve tin, Biolac is more highly concentrated, and is now packaged in 13 fl. oz. cans instead of the former 16 fl. oz. size.

Although the new tin is a smaller size, it contains identically the same food values. And one can of Biolac still makes

one full quart of standard formula. The price remains the same.

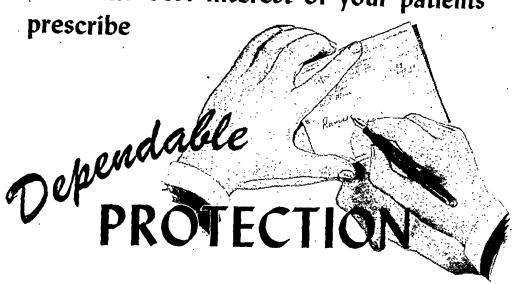

BIOLAC

Borden's complete infant formula\*

\*Biolac is prepared from whole milk, skim milk, lactose, vitamin B<sub>I</sub>, concentrate of vitamins A and D from cod liver oil, and ferric citrate. Evap-

orated, homogenized, sterilized. Vitamin C supplementation only is necessary. For detailed information, write to Borden's Prescription Products Division, 350 Madison Avenue, New York 17, N. Y. ... in the best interest of your patients

## BECAUSE WE REALIZE

that the best interests of patients require that they receive advice on matters pertaining to health from qualified physicians only, we confine all advertising on our gynecological products to physicians and the druggists who serve them.

Careful consideration of all the features of the "RAMSES"\* Flexible Cushioned Diaphragm will, we believe, satisfy the physician that the interests of the patient are served best when "RAMSES" Diaphragms are specified.

\*The word "RAMSES" is the registered trademark of Julius Schmid, Inc.

Velvet smooth pure gum rubber dome, Patented Flexible Cushioned Rim.

423 West 55 St.

HE rationale of this most effective new local sulfonamide treatment lies in this:

Even a single tablet produces, throughout the entire oropharyngeal area—for as long as one hour's chewing—a con-

# FOR THE MORE EFFECTIVE CAL SULFONAMIDE TREATMENT OROPHARYNGEAL INFECTIONS

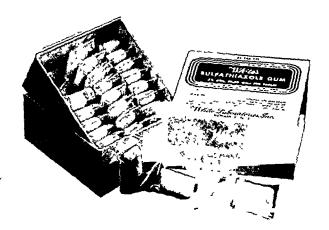

centration of locally active sulfathiazole, dissolved in saliva, averaging 70 mg. per cent. Yet even with maximal dosage over a prolonged time-period—and even in children—blood levels produced are so low as to be immeasurable for the most part, and only rarely even approach 1 mg. per cent.

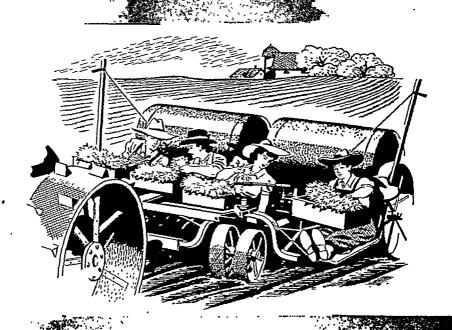

Local efficacy, and freedom from systemic toxicity, have been proved in wide clinical experience to be as impressive as the striking figures cited above would suggest.

White's Sulfathiazole Gum is supplied in packages of 24 sanitaped tablets in slip-sleeve prescription boxes—on prescription only.

# PLENTY OF ACTION THE TOMATO FROM

● Ever see a tomato planting machine in action? That is one pictured above—in a Kemp's Sun-Rayed field. Many of these tractor-drawn machines are manned by women and children who drop the pedigreed seedlings at mechanically timed intervals into furrows which the machine makes, waters, covers. In north central Indiana, where the world's finest tomatoes are grown, we shall pack millions of cans of Kemp's Sun-Rayed brand Tomato Juice to help meet war-time needs. All of it will be made, of course, by kemp's patented process which insures high retention of vitamins A, B₁ and C.

## MP ANATOMICAL SUPPORTS

## **NEPHROPTOSIS**

GETHER with treatment for any existing I infection of the urinary tract, Camp Supports have proven valuable adjuncts in the relief of symptoms in many cases.

Camp-trained fitters have been instructed to consult the physician as to the position required for the fitting, if reclining or partial Trendelenburg. In the event that the physician desires the use of a pad, the fitter has been instructed to obtain information as to the type of pad to be used and to ask the doctor to mark on the garment or blue pencil upon the patient the exact location of the pad.

### Advantages of Camp Supports in Conditions of Nephroptosis:

- 1. The "lifting" power of Camp Supports is from below upward and backward.
- 2. Camp Supports are an aid in improving the faulty posture that sometimes accompanies renal mobility.
- 3. Camp Supports are easily and quickly adjusted.
- 4. Camp Supports stay down on the body by reason of the foundation laid about the pelvis.
- 5. Camp Supports are comfortable.
- 6. Camp Supports are economically priced.

Camp fitters ask patients to return to their physicians for approval of the fitting.

## BEZON\* is harvested:

from natural sources—primary yeast, corn and wheat, providing the Whole B Complex.

It has been found that certain factors of the B Complex are obtainable only from Nature—they cannot be synthesized.

Nutritional investigations indicate that administering a complete combination of the B factors is necessary for optimum results.

**BEZON** is *Whole Natural* Vitamin B Complex, concentrated to high potency from natural sources — no synthetic vitamin factors are added.

BEZON is a Whole Natural Vitamin B Complex which contains one milligram of natural thiamine, two milligrams of natural riboflavin, together with all the remaining members of the B Complex, concentrated in two tabules.

### WHEN YOU NEED A GOOD SUPPORT

FOR REDUCIBLE HERNIA- may we suggest the advantages of

"custom-made" Protection, designed to meet the described needs of each particular case? Physicians, who know from experience, can tell you that Rice "custom-made" Supports for reducible HERNIA are truly different and that our methods are dependable. With dozens of different styles, shapes and types of pads at our disposal and with a full realization of our responsibility to those who put their faith in us-we respectfully offer our services for your approval. Descriptive literature and measurement charts on request.

WILLIAM S. RICE, Inc., (Lock Box 101), ADAMS, NEW YORK BRANCH SUPPLY AND FITTING OFFICES BUFFALO, N. Y.—ROCHESTER, N. Y.—PITTSBURGH, PA.

YOU may order an Arlington Diagnostic Dry Pollen Testing Set made up of the specific wind-borne pollens (trees, grasses, and weeds) indigenous to your state, each set containing a minimum of 23 vials.

Each vial contains 50 mg. dry pollen (sufficient for 30 or more tests) which remains active indefinitely at room temperature. Accompanying this set is a schedule for the botanical area for which the testing material is intended, which names the pollens common to that area, together with their approximate dates of pollination. A supply

of N/20 Sodium Hydroxide is furnished for use as a diluent in testing.

IMPORTANT — since many hay fever sufferers are also sensitive to house dust, a 50 mg. vial of this allergen is included in each diagnostic set.

These 50 mg. vials are packaged in a handy case so that the physician may have immediately available the specific pollens necessary for testing any hay fever patient.

# SOPRONOL (Nhibits FUNGOUS INFECTIONS

MONILIA albicans

EPIDERMOPHYTON inguinale

MICROSFORUM audovini

TRICHOPHYTON purpureum

## ... As demonstrated by clinical investigation in a leading United States hospital

In tests on a large number of hospital patients, Sopronol was found to exert an *inhibitory* rather than a destructive action on the fungus. The advantages of this method are obvious. Sopronol, taken readily into the fungous organism, prevents its development and spread. Hence the infection is quickly brought to an end, but without the customary skin irritation caused by poisonous by-products resulting from strong fungicides in contact with the mold. The chemical basis of Sopronol is sodium propionate.

### ALL SUPERFICIAL MYCOSES (RINGWORM)

Prescribe Sopronol for: Tinea Pedis, Tinea Cruris, Tinea Capitis, Tinea Glabrosa, due to "the dermatophytes"—Trichophyton, Epidermophyton, Microsporum, Monilia (Candida) and pathogenic asper-

gillae infections. Sopronol is non-irritating, non-keratolytic, non-toxic.

Available in alcoholic solution, powder and water soluble ointment bases

## FOR OPTIMAL HEMOPOIETIC RESPONSE

The combination of ferrous sulfate and crude (unfractionated) liver concentrate together with the essential factors of the vitamin B complex has been shown to produce a lasting recovery in chronic secondary anemia—as against the temporary result produced by iron and the B vitamins.

The crude (unfractionated) liver concentrate incorporated in

## ELIXIR HEPATINIC 'MCNEIL'

has definite nutritional advantage over purified, concentrated liver extracts. The crude form retains certain valuable components of the original extract—factors which have demonstrated a hemopoietic effect.

The pleasant taste of Elixir Hepatinic is important since prolonged administration is generally indicated in antianemia therapy.

Each fluidounce contains: Ferrous Sulfate 12 gr., Crude Liver Concentrate (equivalent to 660 gr. fresh liver) 60 gr., Thiamine Hydrochloride 2 mg., Riboflavin 4 mg., Niacinamide 20 mg., with pyridoxine, pantothenic acid, choline and other factors of the vitamin B complex.

Bottles of one pint and one gallon.

McNeil Laboratories

# Statement of Dr. Robert Williams

one of the first to synthesize vitamins

In the old days, when I was one of a group of men working to isolate and then to synthesize the vitamins, I was pretty sure that we were uncovering something quite important to the science of nutrition. But I think that few of us dreamed of the nation-wide application of those discoveries, or the tremendous influence on the theories of nutrition. Now, with

the U.S. Government and the Baking Industry responsible for this new, enriched bread, I am truly thankful that I had the good fortune to share in the development of a movement so plainly advantageous to wartime nutrition and to public health generally."

For the infant deprived of mother's milk

## SIMILAC SIMILAR TO BREAST MILK

A powdered, modified milk product especially pre pared for infant feeding, made from tuberculin tested cow's milk (casein modified) from which part of the butterfat is removed and to which has been added lactose, olive oil, coconut oil, corn oil, and fish liver oil concentrate

Similar provides breast milk proportions of fat, protein, carbohydrate and minerals, in forms that are physically and metabolically suited to the infant's requirements. Similar dependably nourishes—from birth until weaning.

One level tablespoon of Similac powder added to two ounces of water makes two fluid ounces of Similac. This is the normal mixture and the caloric value is approximately 20 calories per fluid ounce.

M & R DIETETIC LABORATORIES, INC. - COLUMBUS 16, OHIO

SINCE the days when a mitral lesion consigned a patient to chronic invalidism", tremendous progress has been made in the treatment of cardiac disorders—so that a much more optimistic prognosis now prevails toward cases of coronary disease<sup>14,1°</sup>

The keynote of today's therapy is "special care over the periods of the acute and subacute phases" -- or symptomatic relief with the avoidance of undesirable side reactions.

This is capably accomplished in many cases with Calpurate—a unique chemical combination of calcium theobromine and calcium gluconate. While it (1) effectively eases venous congestion through a potent vasodilating and diuretic action, and (2) increases cardiac output through myocardial stimulation—Calpurate is remarkably free from gastric urritation's being almost insoluble in the stomach, yet readily absorbable in the intestine.

## SHOES AS THERAPEUTIC AGENTS

No doctor can ignore that shoe therapy is a major factor in the treatment of many foot disorders. In some cases, however, when further medical or surgical treatment is required, the shoes must be adjusted to conform to any changes such treatments make in the shape or size of the feet.

Pediforme shoes are prepared through experienced craftsmen to make the necessary adjustments as prescribed by the orthopedic surgeon or physician in these cases.

With puchases restricted it is readily apparent that substantial shoes, capable of reconstruction or easy adjustment, should be prescribed. For all practical purposes, Pediforme footwear may well be considered in shoe therapy.

A SHOE FOR EVERY MEMBER OF THE FAMILY . . . A SHOE FOR EVERY INDIVIDUAL RE-QUIREMENT.

MANHATTAN, 36 West 36th St. NEW ROCHELLE, 545 North Ave. BROOKLYN, 322 Livingston St. EAST ORANGE, 29 Washington Pl. 843 Flatbush Ave HEMPSTEAD, L.I., 241 Fulton Ave. HACKENSACK, 299 Main St.

The use of non-absorbable alkali marks an advance in ulcer therapy. Widely used, Aluminum Hydroxide Gel is capable of neutralizing large amounts of acid without inducing alkalosis. Alumina gel by intragastric drip is of great value when milk sensitiveness exists.

Aluminum Hydroxide Gel Squibb is a palatable aqueous suspension containing approximately 1.85 grams aluminum hydroxide per fluid ounce. It is sufficiently fluid to pour readily. Its fluidity makes it particularly adaptable to dilution for use by the continuous intragastric drip method.

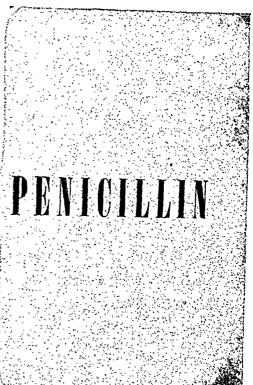

### Supplied in 12-oz. bottles

Literature to physicians on request.

## E:R:SQUIBB & SONS

Manufacturing Chemists to the Medical Profession Since 1858

★ FROM THE BEGINNING, Eli Lilly and Company has been active in the development of Penicillin, and for several months has made it available to the armed forces on government allocation and to the Office of Scientific Research and Development.

The material has been so scarce that very little has been available for civilian use, and then only on special assignment. Even in army and navy hospitals it often was restricted to patients unresponsive to sulfa-drug treatment.

Penicillin'is now more generally available, and research to achieve the ultimate in chemotherapeutic perfection continues as a major project in the Lilly laboratories.

### Workmen's Compensation

On page 1343 of this issue will be found the report to the House of Delegates of the Medical Society of the State of New York at its Annual Meeting of the reference committee on the report of the Council Committee on Workmen's Compensation. We strongly urge that it be read in full and reread by every physician in the State, in simple justice to the great number of physicians, county medical societies, administrators, and insurance companies who have labored honestly, intelligently, and diligently to afford good medical service to injured workmen in the State of New York. It is perhaps too much to hope that much of the report will be given space by the press, principally because of the great rush of other matters. But, for the information of the physicians of the State, we comment upon it in these columns and also print it in full elsewhere in this issue.

Says the report of the reference committee, adopted unanimously in executive session of the House of Delegates and ordered printed:

"It has been through the untiring efforts and specialized knowledge of the Committee and of the Bureau of Compensation that organized medicine, through its component societies, has functioned so well. The rating of thousands of physicians who wished to qualify under the provisions of the law has been a task of great magnitude, and it is the opinion of your Committee that it has been done efficiently and conscientiously. The few complaints that were made by the physicians came from those who thought their ratings were not sufficiently high.

"The Bureau, in addition, has ably fought for the legal and financial rights of the physicians under the Law as amended in 1935, against the innumerable assaults that were made upon these rights. Free choice became more than a legal fiction, at least in upstate New York. Fees were paid promptly, special services were more adequately rewarded, and the arbitration of disputed bills was efficiently handled. The medical profession of the State of New York owes a great debt to this bureau..."

"One would imagine from the newspaper accounts of recent months that the main culprit under investigation by the Moreland Act Commission was the medical profession. It is a fact, however, that not only a portion of the medical profession, but also a portion of the legal profession, some insurance carriers, some employers, the State Insurance Fund. licensed representatives of the workingman, and the administrators of the Department of Labor itself-all were excoriated in the raport to the Governor, and many changes were made in the Law, designed to correct not only evils that had arisen in medical administration but also to curb the very questionable activities in all other departments having to do with the administration of the Compensation Law.

"It may be, perhaps, that the newspapers considered the finding of medical scoundrels to be news, the inference being that the finding of all the other scoundrels in the administration of the Law had no news value."

Indeed, it has become, of late, almost fashionable in many quarters to make of the profession a "whipping boy," for what reason remains to be seen. It is certainly true that there are some scoundrels in the medical profession, as in any other, since its members are human beings; and the report of the reference committee says of them:

"The report of the Moreland Act Commission

revealed two outstanding medical evils: one concerned the commercial laboratories, x-ray and others, supply houses for medical appliances, suppliers of oxygen, etc., and the nefarious financial relationship that existed between them and many physicians; second, the activities of many members of the medical profession were exposed, proving them to be without either honesty or professional honor. A few of the latter formed rings with lawyers and licensed labor representatives, aimed at perverting the very Law itself and depriving the workingman of his just rights. Fee-splitting, bribery flourished on every side."

The Moreland Act Commission, moreover, placed the blame on the compensation boards, especially on four in greater New York, and on the State Bureau for their inaction and neglect in curing these conditions. The reference committee did not feel that this accusation should pass unchallenged.

"First, as to the commercial laboratories: the proposal that the commercial laboratories be banned was proposed by the Pool Committee, and was included in the original draft of the bill that created the amendments of 1935. This was emasculated through the activities of certain commercial interests, and the way was left open for commercialism in compensation practice. Had the suggestion of the medical profession on this point been enacted into law, the problem of the commercial laboratory, with all of its inherent evils, would have ceased to exist in compensation law. It was, therefore, legal for them to function under the law, as it was for a certain percentage of the medical profession, who, by their general lack of morality, cast a sinister shadow over an honorable profession. We hold no brief for these men. We do not defend them. We do not apologize for them. We condemn them without reservation.

"The criticism directed at the compensation boards of the county societies and of your State Bureau by the Moreland Act Commission for their inaction and laxity in curbing these nefarious gentlemen in our opinion is not fully justified, the more so when we see the same commission enact into a law a procedure that would give the county society compensation boards a real power and procedure to deal with professional misconduct.

"The enactment of this law at the request of the Moreland Act Commission is really an admission on the part of the Commission that the capacity and power of the compensation boards was entirely inadequate to cope with the situation."

This seems so obvious as to need no comment, yet it seems to have had no news value—even to PM, an advocate of evenhanded justice to all.

"To infer that the boards were ignorant of the misconduct so rampant around them would be an

insult to their intelligence; that some of them failed to use all the little legal power they had is possible Knowledge of a crime, and even of a criminal, is one thing, but the serious business of putting a permanent stop to the criminal is still another. To do that, one must have power. And the legal powers of the compensation boards in this serious matter were mythical. . . . .

"Incidentally, it was not until May\_4, 1943eight years after the enactment of the amendmentsthat the county societies were informed that they were authorized to subpoena witnesses and render the oath to witnesses. We have in this belated interpretation by the Attorney General of the Civil Practice Act an opinion that it is inherent in the law that the compensation boards of the medical societies have that power. This opinion now is even questioned by legal authorities. The opinion indicated, however, that such authority is not contained in Section 13-d of the Compensation Law itself. If the compensation boards had had that definite authority from 1936 on, there would have been no nose-thumbing at the compensation committees of the county societies, and far less nose-holding when the probers went to work last year.

"Previous to May, 1943, these boards believed they had no such power. Without that power any legal investigation committee is helpless. Without a subpoena a man could refuse to appear, and without an oath only his reputation as a liar would be at stake. The boards had no one to initiate charges no legal investigating committees, no legal advisers—in fact, the boards had no legal teeth at all to bring down the prey.

The reference committee reported that allegations that the Compensation Bureau of the Medical Society of the State of New York and the Compensation Committees of the various county medical societies were inactive or lax, after they were assured of any legal power to try offenders, were, and are, untrue. It displays the evidence that this was so:

"Up to the present time, the various county society boards of the metropolitan area have heard over two thousand physicians—truly a tremendous task, and one indicating a capacity and a determination that they were accused of lacking.

"All of this was done without undue delay, considering the legal questions raised by the counsel for the New York County Society and by others as to the authority of the medical societies to act."

The reference committee also studied the steps taken by the Medical Society of the State of New York concerning the Moreland Act Commission's investigations. These steps will be found in the full report. The reference committee comments:

"We believe that the physicians composing the

compensation boards of the county societies throughout the State—and, of course, that includes those of the Bronx, New York, Kings, and Queens—were in general conscientious, diligent, and trustworthy. Although the rest of the county societies retain their former status, with new powers, under the Law, we feel that the substitution of a three-man medical practice committee for the boards of the above-mentioned societies in Greater New York is an affront to the honor and dignity of the medical profession, and that every honorable effort should be made to modify the new law to the end that these boards be restored to their proper sphere.

"Professional honor is a very personal matter with the men who composed these four boards, and it is our opinion that they should be permitted to function under the new powers granted by the Legisla-

ture.

"We also believe it would make for better administration of the medical aspects of the Compensation Law."

The reference committee comments upon the new law, which becomes operative as this is printed. "Whether all of its provisions are wise can be determined only by experience in its operation." A plea is made for the restoration of the "full activities of the compensation boards of the medical societies of Bronx, New York, Kings, and Queens counties." It makes but one recommendation, based on "a contribution to this subject by a committee of the New York Academy of Medicine, slightly modified. . . . that in so far as the medical aspects of the Workmen's Compensation Law are concerned, the Governor be petitioned to appoint each year a state-wide committee of physicians to review the situation and to suggest such studies or changes as might be indicated in order that weaknesses of the Law or of its administration might be detected and corrected as soon as they become discernible and before they attain undue proportions."

Thus has the reference committee done. The facts speak for themselves. An inestimable service has been done by the Committee to the physicians and the people of

the State of New York.

### Penicillin Therapy

As soon as penicillin therapy had advanced beyond the experimental stage, the Council Committee on Public Health and Education and the New York State Department of Health developed an educational program to assist in the dissemination of the latest information to the medical profession. This plan is in keeping with the postgraduate program of the Medical Society of the State of New York, much of which is presented as a joint endeavor with the nine medical schools of the State, the New York State Department of Health, and several other agencies.

A group of speakers experienced in the use of penicillin therapy is now available for lectures, demonstrations, and clinics at meetings of county medical societies, hospital staffs, and other medical groups. This group of speakers held a conference on penicillin therapy in Albany on Wednesday, April 26, 1944, at the Laboratory of the New York State Department of Health on New Scotland Avenue. The program consisted of introductory remarks by Dr. Edward S. Rogers, Assistant Commissioner for Medical Administration, New York State

Department of Health, and Dr. O. W. H. Mitchell, Chairman, Council Committee on Public Health and Education of the Medical Society of the State of New York. The following scientific program was presented:

"Penicillin as a Type of Antibiotic Substance of Microbiological Origin"

Charles Thom, Ph.D., formerly botanist and mycologist, U.S. Department of Agriculture "The Pharmacology and Production of Penicillin"

Maurice L. Tainter, M.D., Director of Research, Winthrop Chemical Company, Inc.
"Penicillin in the Treatment of Venereal Disease"

J. F. Mahoney, M.D., Director, Venereal Disease Research Laboratory, U.S. Marine Hospital, Staten Island, New York

"The Clinical Use of Penicillin and Other Antibiotics"

Chester S. Keefer, M.D., Chairman, Committee on Chemotherapeutic and Other Agents, Medical Science Division, National Research Council.

At the conclusion of the program at the laboratory, the speakers visited the penicillin plant of the Winthrop Chemical Company.

Several requests have already been received for lectures on penicillin therapy. Meetings have been held in Syracuse, Saranac Lake, and Oneida, and other lectures have been arranged for the Broome County Medical Society and the Sullivan County Medical Society.

County medical societies and hospital staffs interested in this educational program should direct their requests to the Council Committee on Public Health and Education of the Medical Society of the State of New York, Dr. O. W. H. Mitchell, Chairman, 428 Greenwood Place, Syracuse, New York.

We urge all county medical societies to get in touch at once with the Chairman of the Council Committee on Public Health and Education of the Medical Society of the State of New York, to arrange a program on this subject.

It is probable that penicillin will be increasingly available for civilian use as production increases. It is therefore highly important that as many physicians in the State as can do so be instructed in its clinical use at once.

### Nurses for the Armed Forces, II

The need for nurses for the armed forces continues unabated. As was said previously, the quota set for the State of New York for the first half of the year 1944 was 1,957, with the quota for the second half still undetermined at this writing. New York State's reserve of "available" nurses remains about 5,206 (May 15), from which some 1,328 were needed to fill the balance of the first-half quota. Thus on June 30, 1944, there will still be approximately 3.878 "available" nurses remaining from which to supply the requirements of the armed forces for the second half of 1944.

In a previous editorial<sup>1</sup> we touched upon the mechanism by which, now, the Procurement and Assignment Service for Nurses, through its sixty-one local committees and its State committee, obtains the names of registered nurses from nurses' registers or private agencies, hospitals, public welfare associations, industries, and other sources with information on file as to each nurse's age and type of position. We explained briefly that each local nurse Procurement and Assignment committee, composed of representatives from medical, hospital administrative, and lay groups "reviews each case after studying the circumstances existing at the agency employing the nurse," so that, as far as possible, all groups or individuals affected by the nurse procurement program in this State are afforded ample opportunity to be heard before final classification of the individual nurse is made.

It should be made clear that the State

Procurement and Assignment Center for

the nurses is a division of the War Manpower Commission and is responsible not only for the procurement program for the armed forces but also for the conservation of nursing service for civilian necessities. Those physicians who since 1941 have served on P. and A. committees for the procurement of physicians will remember and appreciate the difficulties inherent in any such procurement program for professional people.

After tentative classification of nurses is made by the sixty-one local committees, final classification is made by the State Committee and the names and classifications of available nurses are forwarded for follow-up and individual investigation to the local Nurse Recruitment Committee of the American Red Cross, the official agency for the recruitment (as opposed to procurement) of nurses for the armed forces. After investigation, the Red Cross renders an up-to-date report on the personal circumstances of each nurse to the State Procurement and Assignment Service for final classification. In cases where the individual nurse is available, qualified, and willing, the Red Cross forwards her application for military service.

We have reason to believe that the mechanism of recruitment and procurement of nurses has not been and is not now fully understood either by the medical profession or the public. The assistance of the physicians of the State is highly necessary to the success of the nurse recruitment program. physicians must be convinced of the pressing necessity for nurses for the armed forces; they must be informed of the mechanism by which they are procured by the Man-

<sup>&</sup>lt;sup>1</sup> New York State J. Med. 44: 1201 (1944).

power Commission and recruited by the American Red Cross for military service. They must themselves cooperate whenever possible by releasing nurses from their offices, either for military service if they are 1-A or 1-B-1, or to replace younger nurses who have left from industry or the hospitals. The physicians can be of the greatest service if they will help publicize among their patients the necessity for more nurses for the armed services and if they will discourage luxury nursing and private-duty nursing whenever this seems to be justified by the circumstances.

It is probably true that some hospitals and institutions in the State may be understaffed, temporarily. But

"Volunteer hospitals of the city are in a position to meet any crisis which may arise and have maintained fully the standard hospital services which they performed before the war, Roy E. Larsen, president of the United Hospital Fund, told the Greater New York Fund yesterday.....

"Mr. Larsen said that hospital management has maintained hospital service with the help of volunteers and through the sacrifices of doctors and

nurses, despite a greater patient load.

"He wrote that older doctors are filling in for the younger men called into the service, that nurses have been brought from retirement to supplement depleted nursing staffs, and that hospital volunteers are rendering valuable service in many ways. Disaster equipment and emergency crews have been placed in readiness for any emergency, he said.

The one effect of the war that is giving concern, he said, is depletion of maintenance forces, which is causing hospitals to defer plant rehabilitation."<sup>2</sup>

This statement by Mr. Larsen covers 403 voluntary hospitals in Greater New York. Conditions in some areas in rural and suburban regions may be and probably are worse, at least for the moment. It is possible that some instances can be found of understaffing of hospitals due to withdrawals of nursing personnel to meet the demands of the armed forces.

After all, we are in a war. In the third year of a war. Our immense resources of manufacture and personnel are being strained to meet the requirements of the armed forces, which come first. We may in this year have to live in cooler homes, we may have to forego all but essential automobile driving, we may have to dispense with luxury nursing, unnecessary travel, office nurses, vacations away from home, and many other things we have considered necessary. But what of it? If the men in the armed forces need the nurses, they are going to have them, and we are certain that the physicians of this State will do all in their power to aid the Procurement and Assignment Service for Nurses and the American Red Cross to see that they get all they really need-and quickly.

2 New York Herald Tribune, May 21, 1944.

### Correspondence

Neither the Publication Committee nor the Medical Society of the State of New York is responsible for the opinions expressed in this column. All letters for publication must bear the name and address of the correspondent.

To the Editor: New York State Journal of Medicine Dear Sir:

You who have been privileged to know Dr. James Ewing and his splendid work will be interested in developing a worthy tribute to his memory. The Board of Managers of the Memorial Hospital has named a committee to sponsor this tribute. It was the life-long dream of Dr. Ewing to further enthusiastic interest in tumors and there has been created the James Ewing Memorial for the study and teaching of Neoplastic Diseases.

It is proposed to raise by voluntary subscription the sum of not less than \$150,000, the income of which is to be used to attain the following objectives:

1. To support undergraduate and graduate instruction for medical students at Cornell University Medical College and Memorial Hospital, integrating the clinical, pathological, and therapeutic aspects of tumors.

2. To support a series of not less than two

lectures on recent advances in neoplastic diseases, to be given annually either at the New York

nac Lake, and Oneida, and other lectures have been arranged for the Broome County Medical Society and the Sullivan County Medical Society.

County medical societies and hospital staffs interested in this educational program should direct their requests to the Council Committee on Public Health and Education of the Medical Society of the State of New York, Dr. O. W. H. Mitchell, Chairman, 428 Greenwood Place, Syracuse, New York.

We urge all county medical societies to get in touch at once with the Chairman of the Council Committee on Public Health and Education of the Medical Society of the State of New York, to arrange a program on this subject.

2. To support a series of not less than two lectures on recent advances in neoplastic diseases, to be given annually either at the New York

New York Herald Tribune, May 21, 1944.

Academy of Medicine or at such location as the supervisory committee may see fit.

3. To support such special study as may seem advisable to the supervisory committee.

This fund will be supervised by a self-perpetuating committee to be appointed by the President of Memorial Hospital, ratified by the Board of Managers, selected from the Memorial Hospital and Cornell University Medical College to be composed of not less than five members; three from Memorial

Hospital and two from Cornell University Medical College.

We feel sure that you will want to contribute to this living memorial to a distinguished scientist and a great man. Checks may be made payable to the Memorial Hospital, Ewing Fund, 444 East 68th Street.

Sincerely yours,

ELISE S. L'ESPERANCE
Chairman, Ewing Memorial Committee

## 1944 Scientific Exhibits Awards

The Committee on Scientific Awards is pleased to render the following report after careful study and evaluation of the Scientific Exhibits at the 1944 Annual Meeting of the Medical Society of the State of New York:

#### RESEARCH AWARDS

First Award: Ludwig von Sallmann, M.D., and Karl Meyer, M.D., Columbia University College of Physicians and Surgeons, New York—"Penicillin Ophthalmology."

Second Award: Benjamin Jablons, M.D., and Jules Cohen, M.D., City Hospital and Goldwater Memorial Hospital, New York—"Photoplethysmographic Studies on Circulation."

#### CLINICAL AWARDS

First Award: Henry K. Taylor, M.D., and Teresa McGovern, M.D., Goldwater Memorial Hospital, New York—"Cardioangiography."

Second Award: Lee A. Hadley, M.D., Syracuse Memorial Hospital, Syracuse—"X-Ray Studies of the Spine."

Honorable Mention: William E. Howes, M.D., Gregory L. Robillard, M.D., and Alfred L. Shapiro, M.D., Brooklyn Cancer Institute, Brooklyn—"Salvage Therapy in Advanced Cancer."

Special mention goes to the Halloran General Hospital, R. C. DeVoe, Colonel, (MC), USA, Commanding Officer.

# MEASURES TO PREVENT AND CONTROL AN EPIDEMIC OF RINGWORM OF THE SCALP

GEORGE M. LEWIS, M.D., SEYMOUR H. SILVERS, M.D., ANTHONY C. CIPOLLARO, M.D., EMANUEL MUSKATBLIT, M.D., New York City, and HAROLD H. MITCHELL, M.D., Long Island City\*

A N EPIDEMIC of tinea capitis in New York City caused by Microsporon audouini and involving several thousand children has been spreading for more than a year. A striking increase in the incidence of the disease was first noticed in the Borough of Queens, apparently spreading to other parts of the city during subsequent months. The issue has been inadequately dealt with, partly because of ignorance of its epidemiology, lack of experience because of no prior city-wide outbreak, procrastination because the disease causes no mortality, and the difficulty of carrying out a program of city-wide proportions.

According to information received from dermatologists in other parts of the United States, tinea capitis has become more frequent in many other large cities, apparently approaching the status of an epidemic. This is a unique situation for this country. It is a characteristic of M. audouini to cause localized outbreaks in institutions, but in a search through the American literature we can find evidence of only one citywide epidemic<sup>2</sup> and certainly no record of a pandemic similar to that now affecting children in widely scattered parts of the country.

It is well known that ringworm of the scalp became such a problem in France that infected children were sent to separate schools from those not infected. Sabouraud's solution<sup>3</sup> was epilation of the scalp hair by roentgen rays, and this method of treatment was found to be more effective than any other mode of attack. The present epidemic developed in spite of the availability of this modality, so it is obvious that other measures are necessary in order to bring it under control.

# Possible Causes of the Present Epidemic

It is important to try to establish possible reasons for the epidemic character of the infection, which has heretofore been present as sparadic solitary cases or localized outbreaks. The following factors are considered to have a bearing on the spread of the infection to its present proportions:

Read at the Annual Meeting of the Medical Society of the State of New York, New York, May 10, 1944.

- 1. Decreased maternal care and supervision because mothers are employed in factories and offices.
- 2. Country-wide change of residence of members of the armed forces and war workers. Infected children are moved from place to place,, traveling with their parents to new locales.
- 3. Overcrowding in children's institutions and a rapid turnover in these institutions. Inefficient supervision, partly because of lack of personnel and equipment. Infected children have been known to be discharged to their homes from state institutions.
- 4. The spread of the infection is possible through the medium of barber shops and moving picture houses, the backs of subway seats, and other inanimate contacts. Infected hairs have been found in an East Harlem moving picture house. No barber shops were found to be infected and no other theaters showed hairs which proved to be infected when inspected under filtered ultraviolet rays.
- 5. There is no evidence of increased pathogenicity of M. audouini from limited animal experimentation and tests with trichophytin.

#### The Astoria Project

Since many of our recommendations are based on the lessons learned in this experiment, a brief summary is given. In November, 1942, a school nurse in the Astoria health district, with a population of 240,000, reported an unusual number of children with infected scalps. In February, 1943, the public health and education authorities in this district became aware of an extensive epidemic of ringworm infection among the school children.

It was decided by the District Health Officer to establish a diagnostic center to find the extent of the infection, to assist in diagnosis, and to advise practitioners. A preliminary survey showed that a majority of the cases were treated by the family physicians after a diagnosis of tinea capitis had been made by inspection alone. The diagnostic center was fortunate in obtaining the full cooperation of the school district superintendent and the principals, teachers, and teachers' associations.

All known infected children were asked to come to the diagnostic center for examination. They were examined under the filtered ultraviolet rays.

<sup>\*</sup>The authors were appointed by the Association of Dermatosyphilologists of Greater New York as a special committee to study problems connected with the epidemic of tingworm of the scalp now prevalent in New York City.

Academy of Medicine or at such location as the supervisory committee may see fit.

3. To support such special study as may seem advisable to the supervisory committee.

This fund will be supervised by a self-perpetuating committee to be appointed by the President of Memorial Hospital, ratified by the Board of Managers, selected from the Memorial Hospital and Cornell University Medical College to be composed of not less than five members; three from Memorial

Hospital and two from Cornell University Medical College.

We feel sure that you will want to contribute to this living memorial to a distinguished scientist and a great man. Checks may be made payable to the Memorial Hospital, Ewing Fund, 444 East 68th Street.

Sincerely yours, ELISE S. L'ESPERANCE Chairman, Ewing Memorial Committee

#### 1944 Scientific Exhibits Awards

The Committee on Scientific Awards is pleased to render the following report after careful study and evaluation of the Scientific Exhibits at the 1944 Annual Meeting of the Medical Society of the State of New York:

#### RESEARCH AWARDS

First Award: Ludwig von Sallmann, M.D., and Karl Meyer, M.D., Columbia University College of Physicians and Surgeons, New York—"Penicillin Ophthalmology."

Second Award: Benjamin Jablons, M.D., and Jules Cohen, M.D., City Hospital and Goldwater Memorial Hospital, New York—"Photoplethysmographic Studies on Circulation."

#### CLINICAL AWARDS

First Award: Henry K. Taylor, M.D., and Teresa McGovern, M.D., Goldwater Memorial Hospital, New York—"Cardioangiography."

Second Award: Lee A. Hadley, M.D., Syracuse Memorial Hospital, Syracuse—"X-Ray Studies of the Spine."

Honorable Mention: William E. Howes, M.D., Gregory L. Robillard, M.D., and Alfred L. Shapiro, M.D., Brooklyn Cancer Institute, Brooklyn—"Salvage Therapy in Advanced Cancer."

Special mention goes to the Halloran General Hospital, R. C. DeVoe, Colonel, (MC), USA, Commanding Officer.

(e) When cases are found, a district diagnostic center should be set up. This should function in a manner similar to the Astoria center. It should have as its aim the management of the case from the public health standpoint, assisting in having the patient treated with x-rays by a physician competently trained or serving in a dermatologic clinic. It will also certify that the patient is cured after he has been treated and before he is allowed to return to school. The center will disseminate information to parents, teachers, and children, will help to create good will, and will strive for cooperation among all those interested in the problem.

(f) The city should appropriate sufficient

money for these projects.

(g) Each patient's scalp should be cultured before the x-ray epilating dose is administered.

(h) A pamphlet describing ringworm of the scalp in simple terms should be given to every child in the school before the examining team reaches the school. This pamphlet should also urge the mothers to bring preschool children for examination when the team reaches the school.

#### 2. Education of the Public

The public should be reached through the press, from pamphlets (as mentioned), and by the radio. In this way uninfected children and their parents may be apprised of dangerous habits or practices.

#### 3. Institutions

It is recommended that city-wide, complete, and periodic inspection of children who are in institutions be made by qualified physicians. No child is to return home from an institution unless he has been examined under filtered ultraviolet rays. No child should be accepted for institutional care without a negative report after examination under filtered ultraviolet rays.

### 4. Barber Shops

- (a) The barbers should receive pamphlets from the Department of Health and from the Barbers' Association. They should be told about the epidemic and cautioned to be on the look-out for lesions on the scalp.
- (b) The barbers should be prohibited from cutting the hair of a child known to have or suspected of having ringworm infection.

(c) The possibility of chemical sterilization of barbers' instruments is to be considered.

#### 5. Movies and Other Public Places

We recommend the wearing of hats by children as a precaution against infection in public places such as picture houses, children's clinics, in subways, etc.

#### 6. Preparation for X-Ray Treatment

Clinics which treat infected children should themselves clip and shave the hair prior to epilation, or the parents should be instructed to do so. The parents should be warned not to take an infected child to a barber.

#### 7. Treatment

(a) X-ray epilation is the best available treatment in the majority of cases of scalp ringworm infection due to M. audouini. Cases due to Microsporon lanosum usually do not require roentgen therapy.

(b) The Department of Health should register equipped and properly staffed clinics and qualified physicians for the treatment of ringworm of the scalp. It is hoped that the registration itself will act as a deterrent to improper roentgen

treatment.

(c) It has already been mentioned that the Department of Health should provide a plan for follow-up of the cases to ensure adequate treatment until the patient is free of infection. This could best be accomplished by the establishment of regional centers, based on the experience of the Astoria demonstration.

#### 8. Suggested Methods of Management

(a) It is our belief that x-ray epilation is best carried out under the direction and supervision of a dermatologist. There is often failure to realize that epilation of the scalp is a precise, difficult procedure requiring a calibrated machine and specific training of the operator.

(b) It is our experience that the standardization of x-ray machines in terms of r units varies with the calibrating apparatus. For this reason we suggest that this physical standardization

should be supplemented by biologic tests.

(c) Of the various technics advocated for epilation of the scalp hair with roentgen rays, our experience leads us to believe that the five-point Adamson-Kienboeck method of administration is the most satisfactory for routine use.

(d) Observation of the patient under filtered ultraviolet rays (Wood light) prior to the administration of x-rays is an integral part of the treatment, since it establishes the extent of the infection.

#### 9. Criteria for Cure

It is recommended that no child be permitted to return to school until he is entirely free of infection. At least two negative examinations, one week apart, under filtered ultraviolet rays should be made before the child is referred to the Board of Health for admission to school. We recommend a subsequent examination under the filtered ultraviolet rays one month after return to school.

a culture was taken, and clinical records were kept. All child contacts were examined. New cases were soon found. The past treatment was appraised, and if unsatisfactory, the physician was told of the advantages of referring the patient to a skin clinic or to a dermatologist for the special care required.

The Medical Society of the County of Queens cooperated fully in preparing a letter under its auspices for distribution to the physicians of the county. The letter stated the nature of the epidemic of tinea capitis and suggested that infected children should be treated by qualified dermatologists or in clinics equipped to give roentgen therapy.

The teachers and public health nurses were asked to send to the center all children suspected of being infected. Examination of all children in a school, utilizing the Wood light, soon proved to be a most useful method of discovering new These cases were referred to the diagnostic center for corroboration of the diagnosis, culture, and examination of all known child contacts. Each case was followed by the diagnostic center until cured. Soon the diagnostic center had to take on a new function. Follow-up treatment had to be instituted in cases in which the x-ray epilation was incomplete. Such patients received daily manual epilation until they were cured and returned to school. This service was not available elsewhere except in isolated clinics or offices. The center also made a sincere effort to obtain the cooperation and understanding of the parents, since lay people seldom comprehend the difficulties encountered in treating and curing a case of tinea capitis. This was especially true during the first six months, when treatment failures were common.

Absence from school became a problem because it involved several hundred children in the district. With the cooperation of the school authorities, teachers were assigned to these classes. They conducted four classes: two morning and two afternoon sessions. Since the demand for entrance into these classes was greater than their capacity, admittance was limited to those children whose ringworm infection was complicated by unsuccessful x-ray epilation. Experience had shown that these children would probably have a prolonged absence from school. The diagnostic center was located in the same school so that these children could be kept more readily under observation.

During the five months that these special classes were functioning, 90 infected children received instruction, to the satisfaction of the children, parents, and school and health authorities. Of the 90 children who attended these classes, 56 have been cured and returned to their regular

classes. Thirty-four children are still attending the special classes. A school in the district which had the greatest number of infected cases was populated entirely by white children and served a neighborhood inhabited mainly by skilled workers and civil service employees. Of a total school population of about 900, there were 112 infected children. At present, 14 cases are still active, while 98 have been cured and the children have returned to school.

Rigid standards were set for determining whether a patient was cured. After the patient was considered cured by the clinic or doctor, two consecutive negative examinations by the diagnostic center, a week apart, were required before the child could return to school. The great majority of the children pronounced cured and again attending school had to return to the diagnostic center several times for follow-up examinations at intervals of from two weeks to three months.

Over a period of a little more than a year, 432 children with tinea capitis were registered at the diagnostic center. Of these, 411 had an infection with M. audouini. By April 1, 1944, 362 of these were known to be cured, while 70 cases were still active. X-ray epilation alone, without the aid of after-care and treatment, cured 134 cases. New cases have decreased considerably.

# Measures to Control the Epidemic in New York City

Based on the Astoria demonstration, on our individual experiences in hospitals, in private practice, and in health work, and from discussions among ourselves and with other physicians, we submit the suggestions which follow in the hope that they will form the basis for a public health program adequate for the needs of this community.

#### 1. Case-Finding

- (a) Tinea capitis should be made a reportable disease.
- (b) As a preliminary step to control the present epidemic of ringworm, it is essential to make a city-wide case-finding survey of all school children, using filtered ultraviolet rays (Wood light). No one knows how many cases there are or where they are. Preschool children in the families of infected school children should also be examined.
- (c) The case-finding survey should be repeated every three months.
- (d) The examining team should be equipped and instructed to take material for microscopic examination and cultures when the examination is made. This will help to shorten the period between the discovery of the disease and the active treatment of the patient.

(e) When cases are found, a district diagnostic center should be set up. This should function in a manner similar to the Astoria center. It should have as its aim the management of the case from the public health standpoint, assisting in having the patient treated with x-rays by a physician competently trained or serving in a dermatologic clinic. It will also certify that the patient is cured after he has been treated and before he is allowed to return to school. The center will disseminate information to parents, teachers, and children, will help to create good will, and will strive for cooperation among all those interested in the problem.

(f) The city should appropriate sufficient

money for these projects.

(g) Each patient's scalp should be cultured before the x-ray epilating dose is administered.

(h) A pamphlet describing ringworm of the scalp in simple terms should be given to every child in the school before the examining team reaches the school. This pamphlet should also urge the mothers to bring preschool children for examination when the team reaches the school.

#### 2. Education of the Public

The public should be reached through the press, from pamphlets (as mentioned), and by the radio. In this way uninfected children and their parents may be apprised of dangerous habits or practices.

#### S. Institutions

It is recommended that city-wide, complete, and periodic inspection of children who are in institutions be made by qualified physicians. No child is to return home from an institution unless he has been examined under filtered ultraviolet rays. No child should be accepted for institutional care without a negative report after examination under filtered ultraviolet rays.

### 4. Barber Shops

- (a) The barbers should receive pamphlets from the Department of Health and from the Barbers' Association. They should be told about the epidemic and cautioned to be on the look-out for lesions on the scalp.
- (b) The barbers should be prohibited from cutting the hair of a child known to have or suspected of having ringworm infection.
- (c) The possibility of chemical sterilization of barbers' instruments is to be considered.

#### 5. Movies and Other Public Places

We recommend the wearing of hats by children as a precaution against infection in public places such as picture houses, children's clinics, in subways, etc.

#### 6. Preparation for X-Ray Treatment

Clinics which treat infected children should themselves clip and shave the hair prior to epilation, or the parents should be instructed to do so. The parents should be warned not to take an infected child to a barber.

#### 7. Treatment

(a) X-ray epilation is the best available treatment in the majority of cases of scalp ringworm infection due to M. audouini. Cases due to Microsporon lanosum usually do not require roentgen therapy.

(b) The Department of Health should register equipped and properly staffed clinics and qualified physicians for the treatment of ringworm of the scalp. It is hoped that the registration itself will act as a deterrent to improper roentgen

treatment.

(c) It has already been mentioned that the Department of Health should provide a plan for follow-up of the cases to ensure adequate treatment until the patient is free of infection. This could best be accomplished by the establishment of regional centers, based on the experience of the Astoria demonstration.

#### 8. Suggested Methods of Management

(a) It is our belief that x-ray epilation is best carried out under the direction and supervision of a dermatologist. There is often failure to realize that epilation of the scalp is a precise, difficult procedure requiring a calibrated machine and specific training of the operator.

(b) It is our experience that the standardization of x-ray machines in terms of r units varies with the calibrating apparatus. For this reason we suggest that this physical standardization

should be supplemented by biologic tests.

(c) Of the various technics advocated for epilation of the scalp hair with roentgen rays, our experience leads us to believe that the five-point Adamson-Kienboeck method of administration is the most satisfactory for routine use.

(d) Observation of the patient under filtered ultraviolet rays (Wood light) prior to the administration of x-rays is an integral part of the treatment, since it establishes the extent of the infection.

#### 9. Criteria for Cure

It is recommended that no child be permitted to return to school until he is entirely free of infection. At least two negative examinations, one week apart, under filtered ultraviolet rays should be made before the child is referred to the Board of Health for admission to school. We recommend a subsequent examination under the filtered ultraviolet rays one month after return to school.

# Prevention of Tinea Capitis

In a community in which there are no cases but in which the children may come into contact with the infection, the school board would be well advised to purchase a Wood light and have the school nurse instructed in its use. The children in the schools could then be periodically examined not less than every three months. The teachers should be instructed regarding the clinical appearance of tinea capitis. The children and parents should be given a pamphlet outlining the nature of the disease, emphasizing its difficulty of cure and the importance of avoiding known cases of the infection. They should be advised not to go to camp unless all the children in the camp have been examined and found free of the disease. The possibility that motion picture houses and barber shops are sometimes responsible for dissemination of the disease makes it desirable not to rub the head against the back of the theater seat, and the scalp should be thoroughly washed at home as soon as possible after a haircut.

#### Conclusions

- 1. A serious situation exists in New York City, with an unknown number of cases of tinea capitis.
  - 2. All boroughs of the city are involved.
- 3. In order to control the epidemic, active cooperation between the Health Department, dermatologists, dermatologic clinics, and school authorities is essential.
- The Health Department should lead by declaring the disease reportable, surveying all schools periodically, setting up diagnostic clinics in districts where the disease is prevalent, and disseminating information to the general public.
- 5. Filtered ultraviolet rays (Wood light) are essential in case-finding and in determining when cure has taken place.
- 6. Infections caused by M. audouini should promptly receive the benefit of x-ray therapy. Local measures are usually ineffective.
- 7. Communities free of the disease should take active steps to prevent the disease or to localize any nidus that appears. The small outlay of money necessary to inaugurate and sustain such a plan is in no way commensurate with the probable benefits to be obtained from such a far-sighted effort in the interest of public health.

#### Discussion

Dr. Royal M. Montgomery, New York City-1 heartily concur with everything Dr. Lewis and his coauthors have said. They are to be congratulated on their plan to prevent and control the spread of tinea capitis, which has reached epidemic propor-

All New York clinics have shared in the increased incidence of tinea capitis in the last two years. At the New York Skin and Cancer Unit, between 1935 and 1942 inclusive, an average of 77 cases of tinea capitis were treated each year (Table 1). Microsporon audouini, the causative fungus in this epidemic, was the causative agent in an average of 36.5 cases each year, or 47.4 per cent. The M. audouini cases started to increase above the norm in 1941 and 1942, when 53 and 61 cases, respectively, were treated. In 1943 the total number of cases increased tremendously. Of the 572 cases treated, 496, or 86.7 per cent, were caused by M. audouini. During the first four months of 1944, out of a total of 165 cases, 131, or 83 per cent, were caused by M. audouini.

In upper Manhattan there are many cases of ringworm of the scalp still active.

Too little publicity has been given to this epidemic. Consequently, in many of the schools in New York there have been no examinations of the scalp under filtered ultraviolet light. In order to diagnose the cases and to control this epidemic, examination under this light is essential. Once the program outlined by Dr. Lewis has been brought before parent groups, the faculty of each school, and civic organizations interested in school conditions, better cooperation with the health department can be secured. Once the need for this examination is understood, the means will be made available because of the pressure of public opinion.

The fact that the vast majority of these scalp infections first appear over the occiput would indicate that it may have been contracted following the resting of the head on the back of a seat. Movie seats might be a common source of contagion. It would be advisable to insist that all children be protected by light skull caps while in such places.

TABLE 1 Incidence of Tinea Capitib at the New York Sein and Cancer Unit, New York Post-Graduate Medical School and Hospital, Columbia University, January 1, 1935, to May 1, 1944.

		1935-1942 Average per Year	1943	1944 (4 Months)	Total
Total number of cases of tinea capitis Cases caused by Micro-	616	77	572	165	1353
sporon au- douini Percentage of tinea capitis	292	36.5	496	131	919
caused by Microsporon audonini		47.4	86.7	83	67.9

Properly supervised by a physician and protected by a sterilized cotton skullcap, an infected child should be able to carry on a normal life with his or her playmates. Too often infected children are segregated and become psychiatric behavior problems.

This is an opportune time to stress the fact that all children who attend camps this summer should be examined under filtered ultraviolet rays before their departure. All those infected should be barred. Many children returned from summer camps last fall with ringworm of the scalp.

Dr. Mitchell and Dr. Silvers should be congratulated on the handling of the epidemic in the Astoria district. If this program were initiated in all the health districts in New York I am sure that it would soon bring this epidemic under control.

In view of the fact that there are so many cases of M. audouini infections throughout New York City, I hope that the Health Department will adopt the complete program that has just been so thoroughly discussed.

Dr. Seymour H. Silvers, Brooklyn—Among the 450 children with tinea capitis whom I observed in the Astoria Health District during the past fifteen months, I encountered no serious local or generalized complications from the scalp infection. The most serious and most common complaint of both children and parents was that of loss of educational opportunities and classes missed because of enforced absence from school. The special classes for infected children were opened about eight months after the epidemic was recognized in the district. They were limited to children in the neighborhood of the school, since transportation facilities were not provided Children below the second grade were not admitted to these classes.

My figures show that the number of days lost from school because of tinea capitis varied from 30 to 430. The infected child averaged 151 days lost from school. The child who received successful x-ray epilation lost comparatively little time from school as compared with the one whose x-ray epilation was unsuccessful. In 134 children the x-ray epilation was successful. In 92, or 41 per cent, of the childred epilated with x-ray, it was unsuccessful. These children required additional treatment lasting from two and a half months to one year before they were cured and permitted to return to school.

I believe that if the experiences gained in controlling the epidemic of tinea capitis in the Astoria Health District were applied to other areas where the disease is prevalent, epidemics of tinea capitis could be eradicated and new epidemics could be prevented.

Dr. Emanuel Muskatblit, New York City—It was a pleasure and a privilege for me to take part in discussions which resulted in the report read by Dr. George M. Lewis. I wish to add a few statistical data on the incidence of ringworm of the scalp as observed at the Skin Clinic of New York University. During a period of ten years, from 1930 to 1940, 145 cases were registered. During the last year, from March, 1943, to April, 1944, 111 cases were admitted. Therefore, the incidence of this disease has increased about eight times.

Another point I wish to touch on is the differentiation between the two most common species of fungicausing the disease, namely, Microsporon audouini and Microsporon lanosum. This is of practical importance because the cases due to M. audouini require x-ray epilation, while the cases due to M. lanosum are usually curable by antiparasitic applications alone.

Clinical observation of the scalp is not decisive. It is true that M. audouini usually causes the non-inflammatory forms of tinea capitis, whereas M. lanosum often produces a noticeable inflammatory reaction. There are, however, cases in which M. audouini infection is accompanied by considerable inflammation, even a typical kerion, and M. lanosum can produce entirely noninflammatory lesions.

Microscopic examination of hairs is of no help either, because both species give identical pictures. Some fine differences can be noted at times. In cases caused by M. lanosum a greater abundance of mycelian filaments inside the hair and more frequent presence of such filaments outside of the hairs, in the scales, may be visible. These fine details, however, are not constant and are difficult to observe. The only reliable method of identifying the parasite is by means of cultures. The differential points on Sabouraud's medium are as follows:

- 1. Rate of Growth,—M. lanosum grows about twice as fast as M. audouini. A 2-week-old culture of M audouini will be 1/2 in. in diameter while a culture of M. lanosum of the same age will be 1 in. in diameter.
- 2. Character of Down on Surface of the Colony.— The down of M. audouini is compact and low. It resembles velvet. The down of M. lanosum is loose, luxuriant, and elevated. It resembles cotton.
- 3. Configuration.—M. audouini produces a white, downy, discoid culture which retains this structure for a long time. M. lanosum often develops a flat, brownish, powdery area in the center surrounded by a wide, elevated, downy ring. This feature is more constant on medium made with maltose than on one made with dextrose.
- 4. Production of Pigments.—M. audouini does not produce any pigmentation of the surrounding medium. M. lanosum forms a yellow, soluble pigment which causes discoloration of the medium which is visible on transillumination.
- 5. Pleomorphic Degeneration.—M. audouini does not degenerate. The colony retains its essential features for several months until it dries and dies. M. lanosum degenerates in a few weeks and turns into a mass of loose, white down in which all typical features are lost.
- 6. Microscopic Morphology.—Only one formation is important—the large spindle-shaped spores, the so-called fuseaux. In a culture mount of M. audouini they are either entirely absent or scarce. In M. lanosum they are present in great numbers.
- 7. Fermentation Reactions.—M. lanosum causes rapid fermentation of dextrose and mannitol, which M. audouini does not.
- 8. Pathogenicity for Animals.—M. audouini is not pathogenic for laboratory animals. Inoculations into the skin of guinea pigs, for instance, fail

# Prevention of Tinea Capitis

In a community in which there are no cases but in which the children may come into contact with the infection, the school board would be well advised to purchase a Wood light and have the school nurse instructed in its use. The children in the schools could then be periodically examined not less than every three months. The teachers should be instructed regarding the clinical appearance of tinea capitis. The children and parents should be given a pamphlet outlining the nature of the disease, emphasizing its difficulty of cure and the importance of avoiding known cases of the infection. They should be advised not to go to camp unless all the children in the camp have been examined and found free of the disease. They were limited to children in the neighborhood of the school, since transportation facilities were not provided Children below the second grade were not admitted to these classes.

My figures show that the number of days lost from school because of tinea capitis varied from 30 to 430. The infected child averaged 151 days lost from school. The child who received successful x-ray epilation lost comparatively little time from school as compared with the one whose x-ray epilation was unsuccessful. In 134 children the x-ray epilation was successful. In 92, or 41 per cent, of the childred epilated with x-ray, it was unsuccessful. These children required additional treatment lasting from two and a half months to one year before they were cured and permitted to return to school.

I believe that if the experiences gained in controlling the epidemic of tinea capitis in the Astoria Health District were applied to other areas where the disease is prevalent, epidemics of tinea capitis could be eradicated and new epidemics could be prevented.

Dr. Emanuel Muskatblit, New York City-It was a pleasure and a privilege for me to take part in discussions which resulted in the report read by Dr. George M. Lewis. I wish to add a few statistical data on the incidence of ringworm of the scalp as observed at the Skin Clinic of New York University. During a period of ten years, from 1930 to 1940, 145 cases were registered. During the last year, from March, 1943, to April, 1944, 111 cases were admitted. Therefore, the incidence of this disease has increased about eight times.

Another point I wish to touch on is the differentiation between the two most common species of fungi causing the disease, namely, Microsporon audouini and Microsporon lanosum. This is of practical importance because the cases due to M. audouini require x-ray epilation, while the cases due to M. lanosum are usually curable by antiparasitic applications alone.

Clinical observation of the scalp is not decisive. It is true that M. audouini usually causes the noninflammatory forms of tinea capitis, whereas M. lanosum often produces a noticeable inflammatory reaction. There are, however, cases in which M. audouini infection is accompanied by considerable inflammation, even a typical kerion, and M. lanosum can produce entirely noninflammatory lesions.

Microscopic examination of hairs is of no help either, because both species give identical pictures. Some fine differences can be noted at times. In cases caused by M. lanosum a greater abundance of mycelian filaments inside the hair and more frequent presence of such filaments outside of the hairs, in the scales, may be visible. These fine details, however, are not constant and are difficult to observe. The only reliable method of identifying the parasite is by means of cultures. The differential points on Sabouraud's medium are as follows:

1. Rate of Growth .- M. lanosum grows about twice as fast as M. audouini. A 2-week-old culture of M audouini will be 1/2 in. in diameter while a culture of M. lanosum of the same age will be 1 in. in diameter.

Character of Down on Surface of the Colony .-The down of M. audouini is compact and low. It resembles velvet. The down of M. lanosum is loose, luxuriant, and elevated. It resembles cotton.

Configuration .- M. audouini produces a white, downy, discoid culture which retains this structure for a long time. M. lanosum often develops a flat, brownish, powdery area in the center surrounded by a wide, elevated, downy ring. This feature is more constant on medium made with maltose than on one made with dextrose.

4. Production of Pigments.-M. audouini does not produce any pigmentation of the surrounding M. lanosum forms a yellow, soluble pigment which causes discoloration of the medium which is visible on transillumination.

Pleomorphic Degeneration .- M. audouini does not degenerate. The colony retains its essential features for several months until it dries and dies. M. lanosum degenerates in a few weeks and turns into a mass of loose, white down in which all typical features are lost.

Microscopic Morphology.-Only one formation is important—the large spindle-shaped spores, the so-called fuseaux. In a culture mount of M. audouini they are either entirely absent or scarce. In M. lanosum they are present in great numbers.

7. Fermentation Reactions .- M. lanosum causes rapid fermentation of dextrose and mannitol, which M. audouini does not.

8. Pathogenicity for Animals.-M. audouini is not pathogenic for laboratory animals. Inoculations into the skin of guinea pigs, for instance, fail with rare exceptions. M. lanosum is easily inoculable.

Of these eight differential points, four are the most practical because they can be observed easily and early. They are: rapid growth, luxuriant down, yellow pigmentation of the medium, and abundance of large fuseaux in the culture mount.

Dr. Marion B. Sulzberger, New York City—A few weeks ago I had the privilege of discussing with Commissioner Stebbins, Dr. Theodore Rosenthal, and others of the Department of Health some of the problems connected with the control of ringworm infections of the scalp in children. As Dr. Samuel M. Peck has pointed out so clearly, the problems are complex and not free from numerous practical difficulties. As compared with many smaller centers of population which the U.S. Public Health Service, Dr. Louis Schwartz, and Dr. Peck have been investigating, in New York City the incidence of infection is low in proportion to the total number of school children and to the available facilities for diagnosis and treatment.

Nevertheless, even in New York City there are not sufficient facilities for rapid, accurate, and efficient diagnoses and therapy. The number of physicians and technicians sufficiently instructed and experienced to make the differential diagnosis between ringworm and other scalp conditions and in particular between Microsporon audouini and Microsporon lanosum infections is not adequate. Even the number of clinics with accurately calibrated roentgen ray machines and especially with technicians capable of administering x-ray depilation with surety and safety may well be insufficient.

Dr. Anthony C. Cipollaro, New York City-There exists an epidemic of ringworm of the scalp. Methods for controlling this epidemic and for curing the disease have not been fully utilized. Efforts to control the epidemic and to cure the disease have been made by individual physicians and clinics with partial success. This epidemic affects children in New York City and in such cities as Philadelphia, Pittsburgh, Chicago, and other communities where there is a concentration of population because of war industries. Whether or not this tremendously large number of cases of ringworm of the scalp con- . stitutes an epidemic is for the epidemiologists to decide. So far as I know and so far as many of the dermatologists with whom I have discussed this condition know, there exists an unprecedented number of cases of tinea capitis. The authors of this paper have submitted a plan with two objects in view. The first is to ascertain how many children are infected and the second is to have these children treated adequately. In my opinion it is a useless gesture to open up a so-called ringworm clinic in one of the city hospitals and just apply some local remedies to the scalp. We know and so do all dermatologists who have had experience know that the best treatment for ringworm of the scalp caused by the Microsporon audouini is with x-rays. This method of treatment has stood the test of time and has proved to be successful in practically all cases Other methods which have been sugtreated. gested and which are untried are purely experimental and the percentage of successful results is small.

When x-rays are properly administered one should obtain complete and uniform temporary depilation and a complete cure in practically all cases. Permanent depilation should never occur. Bad results occur occasionally. They are caused by the improper administration of the x-rays. The technic is simple and is very easy to learn. One should take the trouble to learn to administer the x-rays properly and to properly calibrate the x-ray apparatus against biologic and physical standards.

I firmly believe that segregation of infected from noninfected children is absolutely essential. The disease is spread from an infected child to one who is not infected. The infected children should immediately receive an epilating dose of x-rays according to the five-point method of Adamson-Kienboeck.

The successful termination of this epidemic will begin when the interested municipal agencies become aware of the necessity of repeatedly examining every school child and every child with whom they come in contact under the Wood's lamp, as the authors have advocated in their paper.

Dr. George M. Lewis—We are honored to have present here today Dr. Ernest Stebbins, the New York Commissioner of Health, and Dr. Louis Schwartz, Director of the Dermatoses Investigation Section of the United States Public Health Service. This is an indication of the importance of the problem and also a good augury that the public health authorities are becoming aware of the necessity for taking energetic action. Public health officers must realize that one cannot control an epidemic of ringworm of the scalp by utilizing methods which are satisfactory in the control of measles, chickenpox, and other exanthemata.

At the New York Hospital during the past year we have had 175 cases of ringworm of the scalp. Of this group, cure was obtained in 95 per cent, the average time for cure being two and a half months. We believe that grease containing 5 per cent ammoniated mercury should be applied after the x-ray exposure, reapplied each day, and no washing of the hair should be allowed until depilation begins.

It is our considered opinion that children with ringworm of the scalp should not attend classes with normal children. Contrary to the expressed opinion of one armchair strategist, there is no lack of availability of x-ray machines in New York City. There may be a shortage of technicians, but this can be overcome if the need is made known and sufficient money is appropriated. Dr. Cipollaro stands ready to train technicians and physicians who wish to become proficient in the administration of x-rays.

We do not believe that thallium acetate is a safe drug, because a mistake in the dosage may result in death, and even if it is given correctly it is apt to result in damage to kidneys and other organs. We are in sympathy with experimental procedures which may in the future assist in a more speedy cure and be particularly adapted to the treatment of patients in locations where competent roentgen therapy is difficult to obtain. We do believe that at

present there is no adequate and proved local therapy, even with the utilization of penetrating bases or the use of the newer parasiticides, which offers any hope of speedy cure in a high percentage of treated patients.

At this time, in the active treatment of patients with tinea capitis, chief reliance should be placed on the use of roentgen rays. We believe that the other measures advocated in this paper will materially assist in curbing the epidemic.

#### ELECTROCARDIOGRAPHY COURSE IN CHICAGO

The cardiovascular department of Michael Reese Hospital, Chicago, will offer a full-time intensive course in electrocardiography for two weeks—August 21—September 2, 1944. Dr. Louis N. Katz, director of cardiovascular research, will be the instructor.

This is an intensive course offered to the general practitioner and internist. There will be discussion of the principles of the construction and use of electrocardiographic machines, and their demonstration. There will be sessions on interpretations of electrocardiograms, illustrated by lantern slides, and practice by the student with unknown records. Routine records taken during the time of the course will be shown and discussed. Emphasis will be placed on chest leads and on the importance of the

electrocardiogram in coronary sclerosis and myocardial infarction. The mechanism and interpretation of cardiac arrhythmias will be developed. Bedside diagnosis and management will be touched upon.

As group and individual instruction will be given, the course is open to both the beginning and advanced student in electrocardiography. It is planned to individualize the course by group conferences so that at the end of the period each student will be capable of properly interpreting routine electrocar-diograms. In order to accomplish this purpose the class will be limited in number. It is imperative, therefore, that reservations be made early.

For further information address Michael Reese Hospital, Cardiovascular Department, 29th and Ellis Ave., Chicago 16, Ill.

#### QUALIFICATIONS FOR VETERANS' UNEMPLOYMENT BENEFITS

In order to qualify for unemployment insurance benefits under the recently enacted veterans' benefit law, a person must be unable to obtain employment and ready, willing, and able to work, according to Milton O. Loysen, Executive Director of the Division of Placement and Unemployment Insurance of the New York State Department of La-

"Our field offices have reported that many veterans who are employed, as well as men on active duty, have endeavored to claim benefits in the mistaken belief that such payments are in the nature of a State bonus," Mr. Loysen said. "This, of course, is not the case. The veterans' benefit program is designed to provide financial assistance for ex-servicemen and women only while they are seeking employment.

"Men and women released from active duty in the United States armed forces on or after December 7, 1941, may qualify if they resided in this State for at least ninety consecutive days immediately prior to induction, if they now live here and are looking for work here, if they are not entitled to a Federal total disability allowance or unemployment benefits from another state, and if they are able to work but unable to obtain employment.

"Application for benefits should be made at the field offices of the Division of Placement and Unemployment Insurance in the various cities through-

out the State."

#### DR. LIPSCHUTZ WINS SECOND MAYER AWARD

For his research on the growth of animal cells, with particular reference to cancer, Dr. Alexander Lipschutz, director of the department of experimental medicine of the Chilean National Health Service at Santiago, Chile, has won the second \$2,000 prize given by Dr. Charles L. Mayer and administered by the National Science Fund of the National Academy of Sciences.

Dr. Lipschutz has been studying the fibromyomas of the uterus which can be induced in guinea pigs by the injection of certain sex hormones of the fe-

The growths closely resemble the fibromyomas, or "fibroids," which occur in women during the childbearing period.

He and his associates have sought means to prevent the occurrence and enlargement of the growths while the hormones are still acting and recently they have found that some other hormones from other organs have this effect, as do also certain substances

synthesized by chemists.

The award was presented at the annual meeting of the National Academy of Sciences in Washington, D.C., in April.

with rare exceptions. M. lanosum is easily inoculable.

Of these eight differential points, four are the most practical because they can be observed easily and early. They are: rapid growth, luxuriant down, yellow pigmentation of the medium, and abundance of large fuseaux in the culture mount.

Dr. Marion B. Sulzberger, New York City—A few weeks ago I had the privilege of discussing with Commissioner Stebbins, Dr. Theodore Rosenthal, and others of the Department of Health some of the problems connected with the control of ringworm infections of the scalp in children. Dr. Cipollaro stands ready to train technicians and physicians who wish to become proficient in the administration of x-rays.

We do not believe that thallium acetate is a safe drug, because a mistake in the dosage may result in death, and even if it is given correctly it is apt to result in damage to kidneys and other organs. We are in sympathy with experimental procedures which may in the future assist in a more speedy cure and be particularly adapted to the treatment of patients in locations where competent roentgen therapy is difficult to obtain. We do believe that at

developed diffuse pulmonary edema which cleared gradually with aminophylline and intravenous digitalization. Following this episode the patient began to bring up sputum which was purulent at first and later frankly bloody. The signs in the right lung, particularly the upper lobe, persisted throughout. Without any marked change in his already critical condition, the patient expired on the sixteenth hospital day.

#### Discussion

Dr. Max Trubek: The clinical history was characteristic for the diagnosis of myocardial infarction; the poor muscular quality of the myocardial sounds was confirmatory. The electrocardiographic changes were of the acute T1 and T. variety, denoting anterior left ventricular involvement. The blood pressure was persistently low after its initial drop, although the pulse pressure was never less than 20 mm. The accelerated heart rate was of poor prognostic significance. The temperature course showed periodic elevations; it never returned to a normal base. There were periods of hemoptysis and signs of pulmonary infiltration involving the upper lobes. During the first of such episodes, improvement seemed to follow the use of sulfadiazine. It seemed best, however, to consider that the pulmonary complications were secondary to the heart disease and were due to multiple infarctions. The occurrence of pulmonary infarction subsequent to embolization is often characterized by a brief febrile course.

The broadening of the QRS complexes on the electrocardiogram, interpreted as branch bundle block, seemed to lend support to the idea that we were dealing with infarction of the anterior interventricular septum so that a source of emboli on the right side of the heart became a more definite probability to explain the pulmonary infarctions. The electrocardiogram did not show any of the changes such as could accompany lung infarctions. Perhaps the latter were of too small extent to reveal right ventricular strain, or else the changes due to myocardial infarction were too dominant.

The nonprotein nitrogen value was elevated to 90 mg. per cent on the second hospital day, rose to 180 mg. per cent, and thereafter dropped irregularly to 75 mg. per cent before death. There were, however, no confirmatory evidences of renal failure—the creatinine values were only slightly elevated. The carbon dioxide combining power of the blood was never lowered—the values were all greater than 50 volumes per cent. Serum calcium and phosphorus levels were normal when taken during the second week. One sees here a striking distinction between the anoxemia of extrarenal origin and that which

occurs when there is a disturbance of the acidbase balance (mechanism) in actual renal failure. The repeatedly high urinary specific gravity readings confirmed our belief that the renal parenchyma was not damaged. It was difficult to measure urinary output because of incontinence, but it was seemingly larger than one would expect where the essential fault was diminished cardiac force. It is not unusual for the nonprotein nitrogen value to rise when the blood pressure and pulse pressure fall subsequent to myocardial infarction. There is usually a return to normal when cardiac force and glomerular filtration improve. I do not believe that the abnormal values are the result of necrotic myocardium, or, in this patient, that they were the result of pulmonary infarctions. It is well to recognize that the cause of the nonprotein nitrogen retention is diminished left ventricular force. One need not force fluids; indeed, infusions are contraindicated, in distinction from the case of true uremia. Those measures which improve the pulse pressure will eventually result in reduction of the nitrogen retention. In this patient the nitrogen elevation was recorded before the administration of sulfadiazine and there was never crystalluria or hematuria. It does not seem that use of this drug influenced the selective retention of nonprotein nitrogen. Sulfadiazine was given, 1 Gm. every four hours for three days; at that time the blood drug level was only 8.6 mg. per cent; in true disturbance of renal function the blood retention would have been very much higher.

This case also demonstrates a clinical fact which we have observed in myocardial infarction—the occasional unreliability of the erythrocyte sedimentation rate as a diagnostic procedure. The values frequently do not begin to rise above normal until after the third day in a patient who has myocardial necrosis already obvious by other criteria. In this patient the values were 15 mm. and 13 mm. per hour on the ninth and eleventh days of his illness. The leukocyte count is a more constantly reliable diagnostic index, especially early in the course of this illness.

Dr. Arthur L. Washburn: There was no question of the diagnosis of coronary occlusion. Sulfadiazine was ordered because of the continued rise in temperature and the presence of purulent sputum, which signs were suggestive of pneumonitis superimposed on pulmonary infarction. It was to be noted that the azotemia subsided in spite of the sulfadiazine therapy. The signs in the right upper lobe seemed like consolidation and I do not think any harm was done by the administration of sulfadiazine.

DR. HENRY C. FLEMING: I doubt whether the sulfadiazine made any difference one way or

# Diagnosis

# CLINICOPATHOLOGIC CONFERENCES

FOURTH MEDICAL DIVISION OF BELLEVUE HOSPITAL

Date: April 20, 1944 Conducted by: Dr. Max Trubek

Dr. Mary B. Finck: A 59-year-old white apartment-house superintendent was admitted to the emergency ward on February 23, 1944, complaining of burning precordial pain and palpitation. The attack began six hours before admission while the patient was walking. The pain was severe, radiated somewhat down the left arm, and was accompanied by profuse perspiration, nausea, and moderate dyspnea. During the two years prior to admission the patient had suffered about a dozen such attacks of palpitation, pain, and dyspnea, apparently caused by exertion.

The past history and family history were noncontributory. There was a previous admission for hernia repair in 1940, at which time the blood

pressure was 170/94.

On admission the temperature was 99.2 F.; the pulse, 88; respirations, 22; and the blood pressure, 130/90. The patient was in obvious pain, with moderate dyspnea and orthopnea. His skin was pale and clammy. The eyes, ears, nose, and throat, including fundi, appeared normal. The neck veins were distended and filled from below. The lungs showed a few moist rales at the right base. The heart was moderately enlarged and showed many premature contractions. There was a blowing systolic murmur at the apex. The sounds were of poor quality. During the examination the patient had several attacks of palpitation, transitory in nature, during which the pulse dropped to 40 per minute and was regular. The liver extended one fingerbreadth below the costal margin and was tender. There was no peripheral edema.

Laboratory Data.—The red blood count was 4,600,000, with 12.5 Gm. of hemoglobin. The white blood count was 14,150, with 80 per cent polymorphonuclears and 12 per cent lymphocytes, 6 per cent stab forms, and 2 per cent monocytes. Urinalysis showed a specific gravity of 1.036; albumin, 1 plus; glucose, 2 plus; and a few white blood cells on microscopic examination. The blood nonprotein nitrogen was 90 mg. per cent; creatinine, 1.76 mg. per cent; and the blood Wassermann was negative. On February 26, the red blood count was 5,300,000, with 16.5 Gm. of hemoglobin; the white blood count was 22,700 and the urinalysis showed 1

plus albumin, 1 plus glucose, and the microscopic examination showed granular casts. On February 28 the blood nonprotein nitrogen was 165 mg. per cent; creatinine, 2.5 mg. per cent; the blood sulfadiazine level, 5.8 mg. per cent; and the white blood count, 10,700. On February 29 the blood nonprotein nitrogen was 180 mg. per cent; on March 1, 129 mg. per cent; creatinine. 2 mg. per cent; and the blood sulfadiazine level. 8.6 mg. per cent. On March 2 the blood nonprotein nitrogen was 100 mg. per cent; the creatinine, 1.76 mg. per cent; carbon dioxide combining power, 50 volumes per cent. The erythrocyte sedimentation rate at this time was 15 mm. per hour; the red blood count, 4,730,000: hemoglobin, 1.30 Gm.; and the white blood count, 15,400. On March 6 the blood nonprotein nitrogen was 64 mg. per cent and the carbon dioxide combining power was 60 volumes per The blood calcium was 9 mg. per cent; the phosphorus, 3.43 mg. per cent. The urinalysis showed a specific gravity of 1.022, 1 plus albumin, no glucose, moderate hyaline casts, and a few red blood cells. On March 7 the blood nonprotein nitrogen was 75 mg. per cent. Serial electrocardiograms showed progressive acute changes in leads I and IV.

Course.—The temperature showed a gradual rise to 103.8 F. on the fifth day, dropped to normal coincidentally with the administration of sulfadiazine, and then rose again irregularly to 102.4 F. on the day before death. The pulse rate varied between 88 and 120 per minute, corresponding to the temperature. The blood pressure dropped to 85/50 very soon after admission. Subsequently, the lowest reading was 74/50, on the fourth day; the highest, 104/80 on the sixth day; and the final reading was 80/60 on the day before death. The patient was extremely weak and often irrational throughout his illness. He was incontinent, but the estimated urinary output was moderately good. Oxygen and sedation were necessary almost constantly. On the fifth day the lungs still showed only a few rales at the bases, but in view of the temperature of 103 F., sulfadiazine was started and continued to 19 Gm. over the next three days. Signs of patchy pulmonary involvement, particularly in the right lung, became evident by the seventh day. On the ninth day the patient

developed diffuse pulmonary edema which cleared gradually with aminophylline and intravenous digitalization. Following this episode the patient began to bring up sputum which was purulent at first and later frankly bloody. The signs in the right lung, particularly the upper lobe, persisted throughout. Without any marked change in his already critical condition, the patient expired on the sixteenth hospital day.

#### Discussion

Dr. Max Trubek: The clinical history was characteristic for the diagnosis of myocardial infarction; the poor muscular quality of the myocardial sounds was confirmatory. The electrocardiographic changes were of the acute T1 and T4 variety, denoting anterior left ventricular involvement. The blood pressure was persistently low after its initial drop, although the pulse pressure was never less than 20 mm. The accelerated heart rate was of poor prognostic significance. The temperature course showed periodic elevations: it never returned to a normal base. There were periods of hemoptysis and signs of pulmonary infiltration involving the upper lobes. During the first of such episodes, improvement seemed to follow the use of sulfadiazine. It seemed best, however, to consider that the pulmonary complications were secondary to the heart disease and were due to multiple infarctions. The occurrence of pulmonary infarction subsequent to embolization is often characterized by a brief febrile course.

The broadening of the QRS complexes on the electrocardiogram, interpreted as branch bundle block, seemed to lend support to the idea that we were dealing with infarction of the anterior interventricular septum so that a source of emboli on the right side of the heart became a more definite probability to explain the pulmonary infarctions. The electrocardiogram did not show any of the changes such as could accompany lung infarctions. Perhaps the latter were of too small extent to reveal right ventricular strain, or else the changes due to myocardial infarction were too dominant.

The nonprotein nitrogen value was elevated to 90 mg. per cent on the second hospital day, rose to 180 mg. per cent, and thereafter dropped irregularly to 75 mg. per cent before death. There were, however, no confirmatory evidences of renal failure—the creatinine values were only slightly elevated. The carbon dioxide combining power of the blood was never lowered—the values were all greater than 50 volumes per cent. Serum calcium and phosphorus levels were normal when taken during the second week. One sees here a striking distinction between the anoxemia of extrarenal origin and that which

occurs when there is a disturbance of the acidbase balance (mechanism) in actual renal failure. The repeatedly high urinary specific gravity readings confirmed our belief that the renal parenchyma was not damaged. It was difficult to measure urinary output because of incontinence, but it was seemingly larger than one would expect where the essential fault was diminished cardiac force. It is not unusual for the nonprotein nitrogen value to rise when the blood pressure and pulse pressure fall subsequent to myocardial infarction. There is usually a return to normal when cardiac force and glomerular filtration improve. I do not believe that the abnormal values are the result of necrotic myocardium, or, in this patient, that they were the result of pulmonary infarctions. It is well to recognize that the cause of the nonprotein nitrogen retention is diminished left ventricular force. One need not force fluids; indeed, infusions are contraindicated, in distinction from the case of true uremia. Those measures which improve the pulse pressure will eventually result in reduction of the nitrogen retention. In this patient the nitrogen elevation was recorded before the administration of sulfadiazine and there was never crystalluria or hematuria. It does not seem that use of this drug influenced the selective retention of nonprotein nitrogen. Sulfadiazine was given, 1 Gm. every four hours for three days; at that time the blood drug level was only 8.6 mg. per cent; in true disturbance of renal function the blood retention would have been very much higher.

This case also demonstrates a clinical fact which we have observed in myocardial infarction—the occasional unreliability of the erythrocyte sedimentation rate as a diagnostic procedure. The values frequently do not begin to rise above normal until after the third day in a patient who has myocardial necrosis already obvious by other criteria. In this patient the values were 15 mm. and 13 mm. per hour on the ninth and eleventh days of his illness. The leukocyte count is a more constantly reliable diagnostic index, especially early in the course of this illness.

Dr. Arthur L. Washburn: There was no question of the diagnosis of coronary occlusion. Sulfadiazine was ordered because of the continued rise in temperature and the presence of purulent sputum, which signs were suggestive of pneumonitis superimposed on pulmonary infarction. It was to be noted that the azotemia subsided in spite of the sulfadiazine therapy. The signs in the right upper lobe-seemed like consolidation and I do not think any harm was done by the administration of sulfadiazine.

DR. HENRY C. FLEMING: I doubt whether the sulfadiazine made any difference one way or

the other; it probably did not help, although the patient may well have had patches of broncho-pneumonia.

Dr. Arnold Koffler: The nitrogen retention is very interesting. We all have seen elevation of the nonprotein nitrogen in coronary thrombosis and in any condition where shock is present, but the persistence was unusual in this case. The evidence against actual kidney involvement is strong. Since most mural thromboses occur in the left ventricle, it is difficult to understand how the pulmonary infarction arose on that basis.

The electrocardiogram did not show changes characteristic of pulmonary infarction.

Dr. Max Trubek: We thought that the infarction was in the septum, with extension to the right side, so that mural thrombi may have formed on both sides. The electrocardiogram eventually did show branch bundle block.

DR. ABRAHAM W. FREIREICH: It is unusual to have such a high and prolonged nonprotein nitrogen of extrarenal origin. If you think that the septal thrombus was producing pulmonary infarction, is it not possible that the patient might have had renal infarctions as well?

DR. MAX TRUBEK: The patient had no hematuria and we had no evidence of kidney pain, because the patient was too disoriented to be sure of the latter.

DR. HAROLD J. LIVINGSTON: Occasionally with a small amount of sulfadiazine therapy and a low blood sulfadiazine level, there is, on autopsy, kidney damage (crystallization and necrosis), which may be marked even without urinary findings. However, these cases usually have a poor output. Lederer brought attention to the pathologic changes in chemotherapy deaths. The lesions of focal necrosis were described by him in all the parenchymatous organs, including the kidneys.

DR. CHARLES H. NAMMACK: It is interesting to note that the patient had glucose in the urine. Many patients with coronary thromboses do show glycosuria, but it is unfortunate that a fasting blood sugar was not taken.

DR. OTTO STEINBROCKER: I think that the renal picture was, in good part, associated with the cardiac condition. Perhaps intercapillary glomerulosclerosis could account for the glycosuria.

DR. ARNOLD KOFFLER: In the history it was noted that the patient had transitory attacks of palpitation during which the pulse rate dropped to 40 per minute. The subjective symptom of palpitation is usually due to rapid or irregular heart action. It is possible that the patient had a block at that time.

DR. CHARLES H. NAMMACK: Palpitation is a

"heart consciousness" and is not necessarily a disturbance in heart rate or rhythm.

DR. MAX TRUBEK: In anterior septal infarction there is not so likely to be a resultant arrhythmia as when the posterior half of the septum is involved. In the latter area, the infarct proceeds because of closure of the right coronary artery in its posterior portion and frequently involves the vessels supplying the atrioventricular node so that disturbances of conduction are frequently seen. In infarction of the anterior portion of the septum, branch bundle block may be expected, as occurred in this patient and as was shown in the electrocardiogram.

#### Presentation of Pathology

DR. ROBERT POPPITI: At necropsy, the body was that of a 59-year-old well-nourished white man. There were no external findings of note. Each pleural cavity contained 1,000 cc. of clear serous fluid. The cardiac area was enlarged.

The heart was generally enlarged because of hypertrophy and dilatation—it weighed 560 Gm. There were no thrombi within the right auricular appendage. The endocardial lining of the right ventricle was smooth, glistening, and transparent. The underlying musculature appeared natural. Adherent to the endocardial surface of the left ventricle in the region of the apex and interventricular septum was a mural thrombus measuring 3 by 5 cm. The heart muscle underlying the thrombus was soft and necrotic. Both main coronary arteries exhibited a severe degree of atherosclerosis with narrowing of their lumina 2 cm. distal to their origin. The anterior descending branch of the left coronary artery was completely occluded by a partially organized thrombus.

Both lungs were enlarged. The right weighed 750 Gm. and the left weighed 620 Gm. Several fresh infarcts were found in the upper and lower lobes of both. The largest measured 5 by 5 by 4 cm.; the smallest, 2 by 3 by 2 cm.

The liver weighed 1,850 Gm. Its cut surfaces presented a "nutmeg" appearance. Examination of the remainder of the organs revealed no noteworthy changes.

## Microscopic Examination

Heart.—Examination of many sections of the heart revealed a thin film of fibrin on the epicardial surface. The myocardium bordering on the epicardium showed several changes. There was a diffuse replacement of muscle fibers by loose fibrous connective tissue. Large areas of necrosis were noted throughout. These were surrounded by hemorrhage and polymorphonuclear leukocytes. Adherent to the left ventricular endocardium was a large mural thrombus

consisting of tall irregular columns of fused platelets separated from one another by strands of fibrin. Several sections of the right ventricular wall revealed no changes in the myocardium and endocardium.

Coronary Artery (Anterior Descending Branch of Left Coronary Artery).—The lumen of this vessel was narrowed and totally occluded by a thrombus showing organization about its periphery. The intima was thickened because of the presence of several atheromatous plaques containing calcium deposits. The underlying media was thin, atrophic, and contained several vessels, partially surrounded by lymphocytes. The adventitia was natural.

Lungs.-Scattered throughout the lungs were several large groups of alveoli filled with red blood cells. The intervening alveolar septa were necrotic. Bordering about these were other alveoli filled with red blood cells with normalappearing alveolar septa. In the vicinity of one of these infarcts a large vessel was noted which was totally occluded by a thrombus. Additional sections of the right upper lobe revealed it to be filled with a fibrinopurulent exudate.

Liver.—The hepatic cells in the vicinity of the efferent veins were degenerated, thin, and widely spaced. The sinusoids in these areas were correspondingly wide and filled with amorphous eosinophilic débris and red blood cells. Toward the portal areas the cords resumed their natural appearance.

Microscopic examination of the remaining organs revealed no noteworthy changes.

### Anatomic Diagnoses

#### BRITISH NOT PROUD OF PANEL SYSTEM, AMERICAN DOCTOR SAYS

Thousands of words have been written, perhaps many of them wasted, in discussion pro and con concerning the health insurance of Great Britain. Frequently the argument waxes so warm that the sub-ject is accorded more importance than would appear justified if we consider the following comment from one of our own observers:

"I am very proud of my professional liaisons here. The upper crust of British medicine is fully equal to ours, though the general average may not be quite as

high.
"Incidentally, I have never yet met an English
"member of a panel. My secretary, who is typing this letter, does not even know what it means. The panel system, apparently, is that in which a few poor-salaried doctors take care

of a large practice of indigent and ignorant pa-

"You insult any Englishman by asking him if he belongs to a panel. Beveridge or no Beveridge, this country is going to practice private medicine after the war, and up to now, if we admit that compensation work is 'state medicine' at home, England has less state medicine than the United States. Intelligent people in Great Britain insist upon selecting

their physicians, and always will."

The writer of the above, whose name we omit for military reasons, is no casual or fly-by-night observer, but a Rocky Mountain physician of highest attainments, who has known Britain in peace and through two wars. We prefer his word over that of some of our professional uplifters in Washington who would have us believe that for Englishmen generally the sun rises and sets in the so-called panel system of politically managed health insurance.-Rocky Mounlain M. J., April, 1944

### CATIONIC SOAP

The term "cationic soap" is applied to synthetic detergents which are excellent germicides and are also effective skin cleansers when employed in aqueous solutions at about 1 per cent concentration. In the course of studies on the effectiveness of these agents for rapid degermination of the hands, Miller and his colleagues discovered that they deposit a

nonperceptible film on the skin. This film retains bacteria underneath it and is resistant to mechanical trauma; whereas the outer surface exerts a strong germicidal action, the inner surface of the film has a low bactericidal power. These observations introduce a further complication into the evaluation of products of this type.—J.A.M.A., March 11, 1944 the other; it probably did not help, although the patient may well have had patches of bronchopneumonia.

Dr. Arnold Koffler: The nitrogen retention is very interesting. We all have seen elevation of the nonprotein nitrogen in coronary thrombosis and in any condition where shock is present, but the persistence was unusual in this case. The evidence against actual kidney involvement is strong. Since most mural thromboses occur in the left ventricle, it is difficult to understand how the pulmonary infarction arose on that basis.

The electrocardiogram did not show changes characteristic of pulmonary infarction.

Dr. Max Trubek: We thought that the infarction was in the septum, with extension to the right side, so that mural thrombi may have formed on both sides. The electrocardiogram eventually did show branch bundle block.

Dr. Abraham W. Freireich: It is unusual to have such a high and prolonged nonprotein nitrogen of extrarenal origin. If you think that the septal thrombus was producing pulmonary infarction, is it not possible that the patient might have had renal infarctions as well?

DR. MAX TRUBEK: The patient had no hematuria and we had no evidence of kidney pain, because the patient was too disoriented to be sure of the latter.

DR. HAROLD J. LIVINGSTON: Occasionally with a small amount of sulfadiazine therapy and a low blood sulfadiazine level, there is, on autopsy, kidney damage (crystallization and necrosis), which may be marked even without urinary findings. However, these cases usually have a poor output. Lederer brought attention to the pathologic changes in chemotherapy deaths. The lesions of focal necrosis were described by him in all the parenchymatous organs, including the kidneys.

DR. CHARLES H. NAMMACK: It is interesting to note that the patient had glucose in the urine. Many patients with coronary thromboses do show glycosuria, but it is unfortunate that a fasting blood sugar was not taken.

DR. OTTO STEINBROCKER: I think that the renal picture was, in good part, associated with the cardiac condition. Perhaps intercapillary glomerulosclerosis could account for the glycosuria.

DR. ARNOLD KOFFLER: In the history it was noted that the patient had transitory attacks of palpitation during which the pulse rate dropped to 40 per minute. The subjective symptom of palpitation is usually due to rapid or irregular heart action. It is possible that the patient had a block at that time.

DR. CHARLES H. NAMMACK: Palpitation is a

"heart consciousness" and is not necessarily a disturbance in heart rate or rhythm.

DR. MAX TRUBEK: In anterior septal infarction there is not so likely to be a resultant arrhythmia as when the posterior half of the septum is involved. In the latter area, the infarct proceeds because of closure of the right coronary artery in its posterior portion and frequently involves the vessels supplying the atrioventricular node so that disturbances of conduction are frequently seen. In infarction of the anterior portion of the septum, branch bundle block may be expected, as occurred in this patient and as was shown in the electrocardiogram.

#### Presentation of Pathology

Dr. Robert Poppiti: At necropsy, the body was that of a 59-year-old well-nourished white man. There were no external findings of note. Each pleural cavity contained 1,000 cc. of clear serous fluid. The cardiac area was enlarged.

The heart was generally enlarged because of hypertrophy and dilatation—it weighed 560 Gm. There were no thrombi within the right auricular appendage. The endocardial lining of the right ventricle was smooth, glistening, and trans-The underlying musculature appeared natural. Adherent to the endocardial surface of the left ventricle in the region of the apex and interventricular septum was a mural thrombus measuring 3 by 5 cm. The heart muscle underlying the thrombus was soft and necrotic. Both main coronary arteries exhibited a severe degree of atherosclerosis with narrowing of their lumina 2 cm. distal to their origin. The anterior descending branch of the left coronary artery was completely occluded by a partially organized thrombus.

Both lungs were enlarged. The right weighed 750 Gm. and the left weighed 620 Gm. Several fresh infarcts were found in the upper and lower lobes of both. The largest measured 5 by 5 by 4 cm.; the smallest, 2 by 3 by 2 cm.

The liver weighed 1,850 Gm. Its cut surfaces presented a "nutmeg" appearance. Examination of the remainder of the organs revealed no noteworthy changes.

# Microscopic Examination

Heart.—Examination of many sections of the heart revealed a thin film of fibrin on the epicardial surface. The myocardium bordering on the epicardium showed several changes. There was a diffuse replacement of muscle fibers by loose fibrous connective tissue. Large areas of necrosis were noted throughout. These were surrounded by hemorrhage and polymorphonuclear leukocytes. Adherent to the left ventricular endocardium was a large mural thrombus

Address of the President\*
THOMAS A. McGOLDRICK, M.D.

CIR WILLIAM BEVERIDGE, in his report on O medical care for the people of Great Britain, reminds us that in the period of political revolution radical changes in many affairs may be accomplished which would be at other times well nigh impossible. A popular New York daily newspaper says, ". . . . the excitement of the war is being taken advantage of by assorted theorists and fanatics to put their theories on the national statute books." In such wartimes as these many people are prompted, perhaps by worthy motives, to urge permanent changes in nearly every line of endeavor. Some there are who, because of poor foundations for thought and fact, seemingly wish changes simply for change's sake. Every change proposed or made is not in itself progress. In the record of the past may well be found our best guide for the future. In medicine change is ever sought, is eagerly and continually made, prorided it is real progress—if real advancement is being made.

These facts are brought to us, especially in our lives as doctors, in the history of the acquisition of our scientific knowledge with its applicability to the people, and in the long battle for the prevention and eradication of disease. To the superficial mind the character of our progress, the laborious steps of its advance, and the solid foundation of our knowledge are easily overlooked or forgotten in our present accomplishments. We say-and the public accepts it, without apparent emotion or recognition—that within the past twenty-five years the mortality rate in this country has been reduced 50 per cent; that the death rate from the great white plague has been lowered by 60 to 70 per cent; that diphtheria and typhoid groups of diseases have been or can be eradicated; that no serious epidemics have occurred in our land; that 97 per cent of our war-injured recover and many infectious diseases, such as the pneumonias and meningitides, are deprived of their terrors; that the anemias and diabetes are being overcome; that chemotherapeutic applications, the blood transfusions and the plasmas, and so many other lines of progress show that the average of skill and intellectual ability of the doctor is at its highest peak.

skill and knowledge is no closely held luxury, but every day it is more widely distributed to more and more people, and to areas of this continent where hitherto it has not been fully obtainable. The zeal and patriotism of so many thousands of doctors, especially in our own State, to relinquish voluntarily all ties of home, of family, or of personal practice to bring all their ability to the needs of our armed forces are characteristic of the everyday standards of our profession.

With improved means of transportation of doctors or of patients or of supplies by automobile, by rail, and by airplane; with the rapidly increased modes of communication by the press, by radio, by air mail, our most recent advancements in medical knowledge are diffused and quickly become the possession of all.

There are many sections of the country in which, because of partial isolation, scarcity of people, and low general income, there are not at hand sufficient medical facilities. There are many parts of the country to whose people the costs of sudden, unprovided-for illness become a hardship, and treatment sometimes, though rarely, is postponed.

Into such a picture does Federal government It proposes a method of compulsory wage withdrawal insurance to provide all care for 115 to 125 million of the 135 million people in the United States. Its primary object is not for the really completely indigent-for them no provision is made more than at present exists. It would provide for all wage earners, though some of them have annual wages of \$3,000 to \$100,000. and many of them have neither asked nor needed such assistance. At no time does any sponsor of this socialization of medicine criticize unfavorably the present quality of medical knowledge or skill; nor would he, knowingly, desire to retard its progress. The solution of the problem to him is purely economic, can be reached solely by financial ways; and, undaunted by the apparent obstacles, he sees in central government control the specific remedy—the panacea for all medical social ills.

As doctors, however, we have found no panaceas in our medical work. In exchange for the monetary arrangement there would be the surrender of all branches of medicine—the patient,

#### Penicillin Therapy

A LECTURE entitled "Penicillin Therapy" was given before the Medical Society of the County of Warren on June 15, at 8:00 P.M., at the Glens Falls Hospital, Glens Falls.

Dr. R. C. Arnold, United States Public Health Service Surgeon in the Venereal Disease Research Laboratory at the U. S. Marine Hospital, Staten Island, was the speaker.

### St. Lawrence County Society Meets

ON JUNE 22 at noon Dr. Frederick N. Marty, instructor in clinical medicine at Syracuse University College of Medicine, will speak on "Penicillin Therapy" at the Potsdam Club, Potsdam, New York

The lecture has been arranged for the Medical Society of the County of St. Lawrence.

This instruction is presented as a cooperative endeavor between the Medical Society of the State of New York and the State Department of Health.

#### JOURNALS OF THE CHINESE MEDICAL ASSOCIATION

Up to December, 1941, the Chinese Medical Association published two monthly journals, the National Medical Journal (in Chinese) and the Chinese Medical Journal (in English). The National Medical Journal, which was published in Shanghai, since it was in the Chinese language, was edited primarily for the medical profession in China. The Chinese Medical Journal, which was published in Peiping, aimed to place before the medical world abroad the scientific work of the Chinese medical profession through the medium of the English language. The December, 1941, issue of the National Medical Journal was Volume 27, Number 12, while that of the Chinese Medical Journal was Volume 60, Number 12.

The changed war conditions after the attack on Pearl Harbor necessitated the adaptation of these journals to what are in practice three geographical areas: Free China, Occupied China, and the outside world. Sending of journals from any one of these three areas to either of the other two areas was impossible. It was therefore necessary to undertake the publication of the journals within each area in accordance with the purposes of the journals.

The National Medical Journal is being maintained in the form of two editions. The Shanghai edition is continued much as before, as a monthly, the January, 1942, issue being Volume 28, Number 1, and this is being circulated among the medical profession in Occupied China. The Chungking edition first appeared as a bimonthly medical digest in June, 1942, continuing in this form for six issues; then in July, 1943, it was enlarged into its original size, and included original articles as well as the medical digest.

With regard to the Chinese Medical Journal, attempts were made to continue its publication from Shanghai and Chengtu, respectively, but since

the primary purpose of this journal is to reach the medical world abroad, and distribution from either of these two cities was impossible, it was decided to publish it abroad. Accordingly, the Washington edition appeared as of January, 1943, as a quarterly, the first issue being Volume 61, Number 1. In the meantime, the Chengtu edition was also being published as a quarterly, the first issue appearing in October, 1942, as Volume 61 A, Number 1, with a supplement of Medical Abstracts. Further, the Shanghai edition was being published as a bimonthly, the first issue appearing in January, 1942, as Volume 61 B, Number 1. The Chengtu edition, although printed on primitive local paper and in an abbreviated form, was able to bring summaries of medical literature to the English-speaking members of the profession in Free China. The Shanghai edition served a useful purpose in providing for the profession in Occupied China an emergency medium where their scientific work could be published.

It would be wrong to assume from this, however, that three different editions of the Chinese Medical Journal are being edited in three closed areas. While the distribution of journals is impracticable between each area, communication by letter between each of the three areas has been maintained, and the efforts of the respective editors have been directed toward the closest possible cooperation. Articles from each of the three editions have been republished in the other editions, while one of the most important functions of the Washington office has been to prepare and send to China abstracts from current medical journals for publication in both the National Medical Journal (in Chinese) and in the Chengtu edition of the Chinese Medical Journal (in English) —Chinese Medical Journal, July-Sept.

At no time does any sponsor of this socialization of medicine criticize unfavorably the present quality of medical knowledge or skill; nor would he, knowingly, desire to retard its progress. The solution of the problem to him is purely economic, can be reached solely by financial ways; and, undaunted by the apparent obstacles, he sees in central government control the specific remedy—the panacea for all medical social ills.

As doctors, however, we have found no panaceas in our medical work. In exchange for the monetary arrangement there would be the surrender of all branches of medicine—the patient.

Delivered at the 138th Annual Meeting of the Medical Society of the State of New York, New York City, May 9, 1314.

the doctor, the hospital, the institutions of research and education-to a controlling administrator, from whose decisions there could be no court appeal-whose advisers would be of his selection and actually under his authority! The distribution of billions of dollars to hospitals, schools, or doctors would not only be fixed by him but could be changed-increased or diminished or methods altered-whenever he deemed it advisable. As the representative of the government he would stand between the patient and the doctor and would have, through monies at his-disposal, the power to dictate the sufficiency of laboratory aids, the amount of hospital treatment, and to establish regulations for the admission and discharge of hospital patients. It must be remembered that government officials may and have proposed and urged on legislative bodies laws on medical matters and never sought the assistance or advice of any doctor in the United In the actual administration of one such law, one sponsor of this bill publicly announced that all the details would be conducted by the present organization of social security offices, its subdivisions, and the enlarged staffs thereto attached.

The present Emergency Maternal Infant Care Act well illustrates the position of government as a third party between the patient and the physi-The amount of service and the number of consultations of the pregnant woman with her physician; the included compulsory care of any intercurrent, nonrelated illness; the conditions associated with the confinement itself, with complications, subject to its rules and restrictions on additional professional assistance; the responsibility for after-care, including directed examinations after six weeks; the medical service that may be given to the infant in any week of serious illness during the first year of life, by what kind of doctor or clinic it may be prescribed; the number of and indications for prophylactic treatments that may be given during the first year or life; the required reports and the amount of payment -these, all these, are fixed by a central government bureau in Washington and dictated to all the States of the Union. The freedom permitted to any state in the administration of the bill is very little, and demonstrates anew one application of the much favored "grant-in-aid method." How long this measure would be continued after the war, how much wider would be the range of its application, is uncertain. Already, for the coming years, added classes of beneficiaries have been included and the appropriation for the year beginning next July 1 have been placed at 43 million dollars.

To our returning veterans there is no limit to the care that should be given. Service of the

highest quality and to meet every possible need should be ever available and easily accessible. The medical profession is proud of the efforts that have already been made and the results so far attained, and pledge their unlimited cooperation and unrestricted assistance to the medical authorities of the armed forces in their splendid work. It is now proposed that these benefits for veterans should be extended to all the members of their families. That policy was in effect for many years after World War I, and the facilities constructed for veterans were in a great measure devoted to the members of the families. Investigation has shown that the number of returned veterans and the members of their families that would be eligible for such government medical care in the next twenty years would reach 40 There must be recognized a distinct socialistic trend in all these objects of a central government. In this year so far 33 million dollars have been appropriated for construction of twenty thousand hospital beds; 115 million dollars for community facilities including hospitals, in addition to its present appropriation, is authorized under the Lanham Act; a proposed bill, S. 1767, now reported on the floor of the House of Representatives, would appropriate several hundred millions more for additional hospital facili-Without waiting for action on the Wagner-Murray-Dingell-Bill, which would give him 11 million dollars for the purpose, the Surgeon General of Public Health asks an extra 20 million dollars annually to assist states and their political subdivisions in establishing and maintaining adequate public health services. Ten millions a year extra is urged in this bill for his work in tuberculosis, and an unstated number of millions for distribution by the Surgeon General as grants to institutions and individuals for research projects.

Medicine knows better, perhaps, than any other group, the areas in this country with insufficient hospitals and laboratories, where there is need for more doctors to engage in general and special work. It knows that in many places the hospital, nursing, and medical costs of sudden, unprovided-for, prolonged illness find the patient financially unprepared. The apology offered to explain and justify the ever increasing expansion of the central government in the social medical field is that the people in their dire needs are clamoring for help and that certain social security workers and officeholders are simply responding to this incessant pressure.

A recent very careful survey by Opinion Research of the people of this country disclosed that 95 per cent of the people wished no aid in payment of the bills of ordinary sickness—that 77 per cent of the people believed doctors' fees were

fair and reasonable but that for prolonged, expensive costs of sickness 64 per cent believed some method of payment-not monetary assistance-should be arranged; it further showed that 81 per cent opposed Federal medical care of the indigent, while 84 per cent objected to any Federal compulsory insurance plan that would involve a 6 per cent pay-roll deduction. This survey but confirms the knowledge that doctors already possessed. For many years, through their societies, they have proposed, sponsored, or organized prepayment plans to meet the local needs. They have cooperated in the hospitalization arrangements which have solved this costly problem for millions of people; with industrial groups, in companies, or of employees; with cooperative groups, with plans of labor unions and of regular insurance companies, and many others. The voluntary prepayment plans, although now providing for more than a million subscribers, have not yet been developed to their full usefulness; their very many benefits are not yet well known and have not received the enthusiastic support they deserve. Our Council Committee, with our Planning Committee, has presented reports on these plans which are of great interest and show great progress to this convention. I look forward to great results from them.

Our Planning Committee, whose splendid report of its first year is before you, has made an auspicious beginning. Its studies of conditions and needs of this State and the remedies so far suggested carry great promise. It will study further the roles of the State government in medical and health matters, of industry, of medical societies, and of social groups. The education of the people at large to take active part in these subjects is necessary and valuable, as the enlightened public opinion on one recent government bill has shown. This education in the progress, the achievements, the triumphs, and future possibilities of medicine should be intensified. There are in this country more than 12 million followers of the cults and many who are indifferent to and careless of the opportunities at hand for better health. Some of these (misguided) people are honest in their beliefs, some with sufficient intelligence to know better do not possess the real facts, and only the reiteration of what medicine is doing and can do will teach them its real benefits. The truthful medical reports and records of this war, furnished daily by proper authority, of the quality of service being rendered and of the results obtained in the medical care of our forces in all parts of the world, in all climates, in jungles or deserts, on sea or land, in sections infested by organisms of virulent infectious disease; of prevention of sickness as well as the treatment of sick or injured; and of restoration

to health and of rehabilitation should be made known to all our home people; the knowledge of the kind of care our boys in service receive and the medical efforts made for their welfare is of great support to the soldier, as is the feeling that as much care is available for his home folks. During these times the people have seen more clearly the need of the doctor in their lives. They have noted the effects of the absence of so many from their communities, their hospitals, and their industries; and while the public has not suffered the loss of any essential need, the return of their physicians will be gladly welcomed.

#### Summary

There is an important place for the central government in the care of the health of the people. Medical responsibility for such needs is scattered through some fifteen different bureaus. For very many years the medical profession, to secure efficiency, has urged the consolidation of all the health groups except those of the Army and Navy under one head, and that he have the authority of a cabinet minister.

There are lines of work in the health of the public which go beyond the boundaries of any state and necessarily must have such direction as our Public Health Service and its Surgeon General.

There are communities so deficient in medical facilities and so lacking in financial resources that monetary help should be given by the Federal government, without imposing on them any subsequent central bureaucratic control. This the Lanham Act can do and is doing.

When, however, the Federal government continues to seek the care of the individual's health and controls that care and that individual by law, by compulsory directives and mandatory regulations which, in the knowledge of doctors, are known to be detrimental ultimately to the patient and to the progress of medical science, then we have a bounden duty to protest, and to make our protest effective by every lawful means. There are none of these proposed health insurance laws that cannot be administered with more satisfaction to all, with less danger to the quality and progress of medicine, and with more economy, through the individual states and their political divisions.

We, too, as citizens, are much alarmed at the vast additional centralized power these bills would give the bureau at Washington. To it, under the proposed compulsory laws, more than 80 per cent of the people would be directly subjected.

Medicine is a treasury of priceless resources, accumulated through the years—yes, the centuries—never decreasing but ever growing more

opulent. The more that it is distributed, not less is it reduced in any way. To us, its caretakers, is given the privilege of spreading without stint its great benefits. And we will preserve

that treasure, defend it against destruction, protect it against all assailing forces, and transmit it still further enriched with the contributions of our own generation.

#### WHY DOCTORS HAVE CORONARY THROMBOSIS

To the Editor (of the New England Medical Journal): The winter term of school is almost over. In two days peace will reign again. The sun will shine, the buds will burst (if the thermometer ever gets above zero), and I shall be able with tranquil heart to view the moon and stars and breathe the balmy air of spring under a New Hampshire heaven.

The nurse at the school has me licked, beaten to a frazzle, knocked over the ropes. I live in a state of terror and apprehension. If I were an excitable doctor and gave her any encouragement, the infirmary would be full all the time. There would be a steady procession to the hospital of the children, and it would require the full-time work of three or four physicians and surgeons. It would be a nurses' and physicians' paradise. Telegrams would be going out to all parts of the country. Parents would be arriving constantly by airplane, train, and motor car. There would be fractured skulls and broken necks, dozens of cases of appendicitis, pneumonias, meningitis, typhoid fever, embolism, paralyses, epilepsy, contagious diseases of all kinds, failing heart, and shock (fully half the children have been in "shock" at one time or another). I know about the last condition, because I am almost in it myself.

If such a state of affairs existed, this nurse's dream would have come true. She would live in the seventh heaven of bliss. The atmosphere would be charged with rumor, terror, and suspense. She would hover over the "desperately ill" and the dying. She would be the ministering angel; she would be the "Lady with the Lamp." It matters not to her that she never learns by experience, that no mistake ever fazes her. She dramatizes disease as a great actor does his part. The telephone wires burn with messages. The operators must be in a continual state of jitters from the "urgent" (every call is urgent) calls directed at my office or house, day and night. Of course I never believe a word she says over the telephone, but there is always that infinitesimal chance that she may be right. I never know and so I live in mortal fear. The other day after diagnosing five cases of measles in five perfectly healthy children with no fever, cough, rash, or sore throat (one case of measles had occurred at the school two weeks previously, so we were expecting some more, although we had administered placental extract), she called me up three times within five minutes in the middle of office hours to tell me that a boy was having convulsions. He had broken his ankle three days before, and she suggested that he might have

had an embolus to explain the convulsions. She said his respirations were 58 and his pulse rate 60! Leaving several patients in the office I dashed to the school at sixty miles an hour to find the boy asleep and, when waked up, totally oblivious that anything was wrong with him. His pulse was 76 and his respirations were 16. I became incoherent, and if I said anything it was only to mention the name of the deity over and over. After she saw that I was unsympathetic to the embolism theory, she suggested it might be epilepsy. I tore my hair again, but it did

A few days later she again called me up—"urgently"—to tell me that a boy whose ankle I had strapped had suffered "agonizing pain" all night, that the strapping had caused great swelling and that he had paralysis of the foot and ankle. She had me worried, because I did not believe that she knew enough to make up such a story. I had visions of meeting the boy's parents face to face and trying to explain how I had not caused the paralysis, how these things happen once in a while, and how extremely unfortunate it was. I was willing to admit that perhaps I had put on the strapping a little too tightly. So in an agonized frame of mind I made my way to the school to find a foot that was normal in every respect except for the swelling caused by a badly sprained ankle.

A while ago there was a measles epidemic. Every day there were three or four new cases. Toward the end of the epidemic the nurse became tired and nervous, and her mind, which normally was extremely excitable, had reached the explosive state.

While walking with her across the campus, she told me she had found a dead rat I did not say a word. I knew what was working in her mind. Sure enough, the next day the wires began to burn again, and after paging me over the countryside, she at last got me on the telephone "There are two more down," she said, "I don't like it; I don't like it. I think you ought to come to the school immediately." I took my time in getting there, and on arrival found that another doctor had preceded me. I asked her what all the excitement was about. She wouldn't tell me, but I knew. She had made the diagnosis of bubonic plague!

And so I live from day to day, almost in a state of collapse, with the sword of Damocles hanging by a thread above my neck.—N. C. S., in New England J. M., April 6, 1944

WARTIME GRADUATE MEDICAL MEETINGS

Three Wartime Graduate Medical Meetings are scheduled to be held at the Rhoads General Hospital in Utica in June, July, and August

On June 20 Dr. Bertram Levinson will speak on "Malaria." On July 20 Dr. Frederick Marty will

speak on "Blood and Blood Substitutes: Their Indications and Uses."

On August 20 Dr. Roscoe Severance will speak on "Wounds of the Extremities and Their Management."

# Special Report

# Executive Session of the 1944 House of Delegates of the Medical Society of the State of New York

### Excerpt from the Minutes of the Executive Session Relating to Workmen's Compensation

Under ordinary circumstances the Minutes of Executive Sessions of the House of Delegates of the Medical Society of the State of New York are not published but are merely a part of the office record of the Minutes.

However, at its 1944 meeting the House of Delegates in executive session not only took action on the subject of Workmen's Compensation, but also specially directed that its action be published in the JOURNAL.

It is published here in addition to its regular appearance in sequence in the Minutes in the July 1, 1944, issue.

> Louis H. Bauer, M.D., Speaker Peter Irving, M.D., Secretary

THE Report of the Council Committee on Work-men's Compensation is really a resume, not only of the substantial contributions made by the present committee, but also of the work of this committee

and the State Society Bureau during recent years.

A close study of this report to the Council reveals that its members possessed a very comprehensive knowledge of the Workmen's Compensation Law. knew well how the law functioned in reality, and, in addition, had an acute awareness of how it should have been modified in order that it might more com-

pletely accomplish its objectives.

The outstanding work of a former committee of physicians, under the chairmanship of Dr. Eugene Pool, resulted in the amendments to Section 13 of the Workmen's Compensation Law in 1935. All of their recommendations, unfortunately, were not enacted into law. Had their recommendations been fully enacted, much of the bad odor liberated by the recent probers would never have been generated. What this committee of physicians did accomplish, however, was constructive, forward-looking, and of great value. The medical profession was given authority, great responsibility, and the unique power of self-discipline.

The magnificent response of the medical profession to the great obligations imposed upon it by the 1935 amendments is a matter of history. The compensation committees of the county societies have carefully and conscientiously discharged their duties, and your reference committee subscribes to a statement in the report which says: "We believe it is not too much to assert that no interested parties to the Workmen's Compensation Law, not even the Labor Department, have made a greater contribu-tion to the public welfare than the medical profession

through its agencies."

It may be said also that all of the great work done by the various county societies has been but the lengthened shadow of the Workmen's Compensation

Committee of the State Society and of its Bureau.

The prodigious amount of work done by this Council Committee is a monument of honor to the men who have made up the committee and the bureau through the years.

They have been a continuous advisory committee

to all county societies. They were also a public relations committee of the medical profession to the

Department of Labor, the insurance carriers, the employers, and the workingman.

It has been through the untiring efforts and specialized knowledge of the committee and of the Bureau of Compensation that organized medicine, through its component societies, has functioned so well. The rating of thousands of physicians who wished to qualify under the provisions of the Law has been a task of great magnitude, and it is the opinion of your committee that it has been done efficiently and conscientiously. The few complaints that were made by the physicians came from those who thought their ratings were not sufficiently high.

The Bureau, in addition, has ably fought for the legal and financial rights of the physicians under the Law as amended in 1935, against the innumerable assaults that were made upon these rights. Free choice became more than a legal fiction, at least in upstate New York. Fees were paid promptly, special services were more adequately rewarded, and the arbitration of disputed bills was efficiently handled. The medical profession of the State of New York owes a great debt to this Bureau.

Your Council Committee and Bureau have clearly recognized the evils that were inherent in some of the ambiguities and redundancies of the amendments of 1935, and have frequently sought by all means to obtain amendments to the law, to clarify and simplify the statutes so they could be more effectively administered, to the end that the medical profession could more effectively carry out its responsibilities, but to little or no avail.

On January 13, 1944, your Council Committee presented to the Council certain recommendations to be presented to the Moreland Act Commission which was then functioning. These recommendations were approved by the Council. More of this

Since the writing of this report of the Council Committee and the present time the Moreland Act Commission finished its investigations, made its report to the Governor, suggested and had enacted into law many significant changes in the Law from the viewpoint of the medical profession.

opulent. The more that it is distributed, not less is it reduced in any way. To us, its caretakers, is given the privilege of spreading without stint its great benefits. And we will preserve

that treasure, defend it against destruction, protect it against all assailing forces, and transmit it still further enriched with the contributions of our own generation.

dustrial Commissioner requesting him to ask the Attorney General whether there was any provision in the State statutes to enable the State Society to exercise these powers. Finally, on May 3, 1943, the Attorney General gave the opinion that we have mentioned. There is nothing in the Law which states that the Compensation Board must initiate charges against a bureau or a physician. It states merely that it shall hear such charges, determine guilt or innocence, and report its findings to the Industrial Council. The first list of physicians given out by the Moreland Act Commission contained the names of over 1,300 physicians who were accused of unethical conduct. In all, the names of 3,000 were given out. These physicians were under the jurisdiction of the compensation boards of Bronx, New York, Kings, and Queens.

These names were released from time to time, the last not obtained until January, 1944. All of the physicians whose names appeared on the first lists were heard by the societies and either admitted or denied their guilt. For instance, in Kings County, of 1,140 physicians that were named by the Moreland Act Commission, 380 are in the Army and could not be heard, 400 have pleaded guilty, and the 160 who pleaded not guilty have been tried. It was arranged that all who denied their guilt would have a final trial as soon as all the physicians named had an opportunity to be heard in a preliminary hearing. After a great many had been heard the counsel of the New York County Society raised the question of the legality of the proceedings, unless charges were first preferred by the Industrial Commissioner, and it was not until April, 1944, that these formal charges were made by the Industrial Commissioner against all of the accused.

Up to the present time the various county society boards of the metropolitan area have heard over two thousand physicians—truly a tremendous task, and indicating a capacity and a determination that they were accused of lacking.

All of this was done without undue delay, considering the legal questions raised by the counsel for the New York County Society and by others as to the authority of the medical societies to act.

The Department of Labor, as was their apparent right under the Law, held independent hearings to try certain accused physicians. When they revoked the license of one physician to practice under the Compensation Law, he carried it to the Supreme Court, which held that the Department of Labor had no such power.

The medical societies found themselves enmeshed in a web of legal complications, especially if the accused pleaded not guilty and further legal action was warranted. But to say that your Bureau or the medical societies of the metropolitan area were lax or timid, once they were assured of any power, is absolutely untrue.

Your reference committee has also studied the steps taken by the committee on Workmen's Compensation of the Medical Society of the State of New York concerning the Moreland Act Commission's investigations. This report is dated April 27, 1944.

It is a documented statement of the aid given by the State Society committee, by your Compensation Bureau, by the presidents of the five societies in the metropolitan area, by the chairman of the compensation boards of these societies, to the members of the Moreland Act Commission, not only in the investigation, but also by their many and valuable recommendations for the improvement of the

administration of the Compensation Law. Many of these recommendations are embodied in the new Law, and it is beyond the comprehension of your reference committee how this same commission could in any way censure these gentlemen.

We believe that the physicians composing the compensation boards of the county societies throughout the State—and, of course, that includes those of the Bronx, New York, Kings, and Queens—were in general conscientious, diligent, and trustworthy. Although the rest of the county societies retain their former status, with new powers, under the Law, we feel that the substitution of a three-man medical practice committee for the boards of the above-mentioned societies in Greater New York is an affront to the honor and dignity of the medical profession, and that every honorable effort should be made to modify the new law to the end that these boards be restored to their proper sphere.

Professional honor is a very personal matter with the men who composed these four boards, and it is our opinion that they should be permitted to function under the new powers granted by the Legislature. We also believe that it would make for better administration of the medical aspects of the Compensation Law.

Your Council Committee, as we have stated, made certain recommendations to the Moreland Act Commission, by the authority of the Council.

Your reference committee concurs in their validity and wisdom, and although the greater number of their recommendations were recently enacted into law, the few that have not been should be the subject of continued study by this committee, and again advocated, if the operation of the newly amended law would indicate their necessity.

The Moreland Act Commission has enacted into law, which will become operative in June, 1944, many changes that your reference committee wishes to point out. Many of these changes were recommended by your Council Committee to them on January 13, 1944. The essential changes, having not been enacted at that time, obviously were not discussed in the report of the Council Committee, but your reference committee thought it incumbent on it to bring matters up to date. They are as follows:

1. The Industrial Council now consists of nine members instead of fifteen. Three members will be physicians and are called the "medical appeals unit" of the Council. They shall consider all matters connected with the practice of medicine submitted to them by the commissioner and the industrial board, and shall prescribe rules and regulations to govern the procedure of investigations and hearings by medical societies of charges against authorized physicians, laboratories, or bureaus.

2. The compensation boards of the medical societies of the Bronx, New York, Kings, and Queens are abolished, and in their place is set up a single medical practice committee of three outstanding physicians. The compensation boards of the other county societies remain the same as before. The three-man medical practice committee of Greater New York will have the same power as other societies in authorizing physicians, laboratories, and bureaus. In addition, they will be the arbitration committee and the hearing and investigating committee of all charges against physicians, laboratories, or bureaus in the teres.

physicians, laboratories, or bureaus in that area.

3. The method of arbitrating disputed bills in other sections of the State has been modified so

One would imagine from the newspaper accounts of recent months that the main culprit under investigation by the Moreland Act Commission was the medical profession. It is a fact, however, that not only a portion of the medical profession but also a portion of the legal profession, some insurance carriers, some employers, the State Insurance Fund, licensed representatives of the workingman, and the administrators of the Department of Labor itselfall were excoriated in the report to the Governor, and many changes were made in the Law which were designed not only to correct evils that had arisen in medical administration but also to curb the very questionable activities in all other departments having to do with the administration of the Compensation Law.

It may be, perhaps, that the newspapers considered the finding of medical scoundrels to be news, the inference being that the finding of all the other scoundrels in the administration of the Law had no

news value.

The report of the Moreland Act Commission revealed two outstanding medical evils: one con-cerned the commercial laboratories, x-ray and others, supply houses for medical appliances, suppliers of oxygen, etc., and the nefarious financial relationship that existed between them and many physicians; second, the activities of many members of the medical profession were exposed, proving them to be without either honesty or professional honor.

A few of the latter formed rings with law-yers and licensed labor representatives, aimed at perverting the very law itself and depriving the workingman of his just rights. Fee-splitting, bribery flourished on every side.

The Commission, in addition, placed the blame on the compensation boards, especially on four in Greater New York, and on your State Bureau for their inaction and neglect in curing these conditions.

Your reference committee feels that this accusa-

tion should not pass unchallenged.

First, as to the commercial laboratories: the proposal that the commercial laboratories be banned was proposed by the Pool Committee, and was included in the original draft of the bill that created the amendments of 1935. This was emasculated through the activities of certain commercial interests, and the way was left open for commercialism in compensation practice. Had the suggestion of the medical profession on this point been enacted into law, the problem of the commercial laboratory, with all of its inherent evils, would have ceased to exist in compensation law. It was therefore legal for them to function under the law, as it was for a certain percentage of the medical profession who, by their general lack of morality, cast a sinister shadow over an honorable profession. We hold no brief for these men. We do not defend them. We do not apologize for them. We condemn them without reservation.

The criticism directed at the compensation boards of the county societies and of your State Bureau by the Moreland Act Commission for their inaction and laxity in curbing these nefarious gentlemen in our opinion is not fully justified, the more so when we see the same commission enact into law a procedure that would give the county society compensation boards a real power and procedure to deal with pro-

fessional misconduct.

The enactment of this law at the request of the Moreland Act Commission is really an admission on the part of the Commission that the capacity and

power of the compensation boards was entirely inadequate to cope with the situation.

Incidentally, it was not until May 4, 1943-eight years after the enactment of the amendments—that the county societies were informed that they were authorized to subpoena witnesses and render the oath to witnesses. We have in this belated interpretation by the Attorney General of the Civil Practice Act an opinion that it is inherent in the law that the compensation boards of the medical societies have that power. This opinion now is even questioned by legal authorities. The opinion indicated, however, that such authority is not contained in Section 13-d of the Compensation Law itself. If the compensation boards had had that definite authority from 1936 on, there would have been no nose-thumbing at the compensation committees of the county societies, and far less nose-holding when the probers went to work last year.

Previous to May, 1943, these boards believed that they had no such power. Without that power any legal investigation committee is helpless. Without a subpoena a man could refuse to appear, and without an oath only his reputation as a liar would be at stake. The boards had no one to initiate charges, no legal investigating committees, no legal advisers—in fact, the boards had no legal teeth

at all to bring down the prey.

To infer that the boards were ignorant of the misconduct so rampant around them would be an insult to their intelligence; that some of them failed to use all the little legal power they had is possible. Knowledge of a crime, and even of a criminal, is one thing, but the serious business of putting a permanent stop to the criminal is still another. To do that, one must have power. And the legal powers of the compensation boards in this serious matter were mythical.

To say that your Bureau and the compensation committees of the medical societies, especially those of Greater New York, were inactive or lax after they were assured of any legal power to try the offenders is, to put it very mildly, untrue. That there was apparent laxity and inaction previous to this was due to the facts contained in the following paragraph taken from the report of your Council Committee on Workmen's Compensation of Janu-

ary 6, 1944:

"For many years we have been advised that we possessed no such power of subpoena . . . . is evidenced by numerous communications to the Industrial Commissioner and from him to us. Specifically, in the year 1937 the Director of Workmen's Compensation of the State Medical Society requested the then Commissioner to issue subpoenas and provide an officer to administer the oath when required or to have investigations made by the Industrial Council of the Department of Labor, which possesses such power. The Commissioner, accepting the general belief that the medical society did not possess the power to subpoena, etc., agreed to have investigations by the Industrial Council, but such investigations were never held. Our own Counsel and others whom we consulted were of the opinion that unless a specific provision was included in the Workmen's Compensation Law (Section 13-d), we did not possess the powers to subpoena and administer the oath without which no successful investiga-tions or trials could be held."

After the appointment of the Moreland Act Commission and the election of a new Attorney General, the Director of your Bureau again wrote to the In-

# Medical Society of the State of New York Minutes of the House of Delegates—May 8-9, 1944

#### INDEX

The Monday morning session and part of the Monday afternoon session appear in this issue (Sections 1-49). The rest of the Monday afternoon session and the Tuesday sessions will appear in the July 1 issue (Sections 50-96).

that now the arbitration board shall consist of two members of the local county society, two from the State Society, and one appointed by the

commissioner.

4. Conviction of fee-splitting in all its forms is now penalized by loss of authorization to function under the Compensation Law, and is also a misdemeanor. In addition, conviction carries with it possible loss of license to practice medicine under the newly amended Education Law. Incidentally, any other person not a physician who attempts to aid a physician in splitting a fee is also guilty of a misdemeanor.

Under the new Law, commercial x-ray laboratories are put out of business, and only a roent-genologist authorized by the compensation boards or by the medical practice committee can

practice as such under the Law.

The medical practice committee in New York City and the compensation boards elsewhere are now to have real power as well as legal assistance in hearing and investigating charges of misconduct against either physicians or licensed bureaus and laboratories.

7. All medical bureaus, laboratories, etc., henceforth must be licensed by the commissioner, and the new changes in the Law make possible standards of efficiency and professional competency never possible under the old law. In addition, the power to discipline is now very definite.

8. It is now the law that any interference by any person with the selection by an injured employee of an authorized physician to treat him, and the improper influencing or the attempt to influence the medical opinion of any physician who has treated or examined an injured employee shall be a misdemeanor. (That takes this common practice out of the realm of fun, and places it in a criminal category.)

When a claimant is to be examined by a physician employed by the Department of Labor, no physician employed by the employer, carrier, or employee shall be present at, or participate in any

manner in, such examination.

10. No claim for medical or surgical treatment will be valid in the future unless within fortyeight hours the physician makes a report to the employer, and also directly to the Industrial Commissioner. Insurance carriers, also, when they have a claimant examined, must file a copy of the report directly with the Industrial Com-

missioner within ten days.

11. The new Law also authorizes the Industrial Commissioner to employ physicians of outstanding qualifications as committees of expert consultants in such fields of medicine as he deems essential in order to ascertain the diagnosis, causal relationship, adequacy of medical or surgical treatment in cases where such matters are not readily determinable by the regularly employed medical examiner in the Workmen's Compensation division.

It is interesting to note that under the

new Law the Industrial Commissioner is made an absolute power. None of the recommendations made to him by a county society board, by the medical practice committee in New York City, by the medical appeal unit of the Industrial Council, are final, binding, and conclusive on him, as in the old law. They are now advisory only, and if he wishes to ignore them he may legally do

The new Law will soon be effective, and should correct many evils. Whether all of its provisions are wise can be determined only by experience in its operation. The significance of your Bureau will become apparent. The importance of its work in the past can be estimated only by one who has studied

the importance of its manifold activities.

It is estimated that under this Law in New York State \$20,000,000 is paid annually for the professional services of physicians. To strive on the one hand to protect the financial rights of the physicians and, at the same time, to insure that the quality of medical service delivered to the workingman is of the highest possible quality, are among a few of its functions. Its other duties have been many, arduous, and exacting, and it is the opinion of your reference committee that they have all been discharged in a very adequate manner. It should have the enthusiastic and unwavering support of the medical profession. The Bureau of the State Medical Society and the personnel of the medical profession are partners in the great enterprise of rendering the highest type of medical care to the workingman, and the dignity and competence of each is reflected by the other. We accept the challenge of the future with confidence and high determination.

We feel sure that your Council Committee and Bureau will ever bear in mind the obligation to use all honorable means to restore the full activities of the compensation boards to the societies of Brony, New York, Kings, and Queens. While we await the functioning of the new Law, your reference committee has but one recommendation to make.

It is one that we have obtained from a study of a contribution to this subject by a committee of the

New York Academy of Medicine.
Our recommendation is this: That in so far as the medical aspects of the Workmen's Compensation Law are concerned, the Governor be petitioned to appoint each year a state-wide committee of physicians to review the situation, and to suggest such studies or changes as might be indicated in order that weaknesses of the Law or of its administration might be detected and corrected as soon as they become discernible and before they attain undue pro-

Your reference committee moves the adoption of

this report.

# House of Delegates

# Minutes of the Annual Meeting

## May 8 and 9, 1944

THE 138th Annual Meeting of the House of Delegates of the Medical Society of the State of New York was held at the Hotel Pennsylvania, New York City, on Monday, May 8, 1944, at 10:10 A.M.: Dr. Louis H. Bauer, Speaker; Dr. William Hale, Vice-Speaker; Dr. Peter Irving, Secretary; Dr. Edward C. Podvin, Assistant Secre-

SPEAKER BAUER: The House will be in order.

Section 1. (See 35)

Report of the Reference Committee on Credentials

SPEAKER BAUER: The Chairman recognizes the Assistant Secretary, Dr. Podvin.

Assistant Secretary Podvin: Mr. Speaker, there are no disputed delegations, and all on our rolls

are entitled to vote. SPEAKER BAUER: I declare the 138th Session of the House of Delegates of the Medical Society of the State of New York open for the transaction of busi-

Mr. Assistant Secretary, how many delegates are

registered?

ASSISTANT SECRETARY PODVIN: I cannot give you the number at the present time, but there is obviously a quorum present, Mr. Speaker.

SPEAKER BAUER: A quorum being sixty delegates,

it is manifest that a quorum is present.

Section 2

#### Approval of the Minutes of the 1943 Session

Assistant Secretary Podvin: I move that the reading of the minutes of the 1943 Session of the House be dispensed with, and that they be approved and adopted as published in the June 15 and July 1, 1943, Issues of the New York State Journal of MEDICINE.

Dr. Benjamin M. Bernstein, Kings: I second

that motion.

... There being no discussion, the motion was put to a vote, and was unanimously carried. . . . .

Section 3

#### Reference Committees

SPEAKER BAUER: Will you read the Reference Committee appointments? There are a number of changes, so please pay particular attention to the

ASSISTANT SECRETARY PODVIN: The Reference Committees of the 1944 House of Delegates are as

REFERENCE COMMITTEE ON CREDENTIALS: Peter Irving, Chairman, New York County Charles F. McCarty, Kings County Edward C. Podvin, Bronx County John A. Pritchard, St. Lawrence County Roy E. Wallace, Seneca County

These things will come up before the Reference Committees, and more of the details will undoubtedly be reported later; consequently, any further remarks that I may wish to make on that and allied subjects I will be glad to present afterwards, as the subjects are brought up on the floor for discussion. (Applause)

SPEAKER BAUER: Thank you, Dr. McGoldrick! The remarks of the President are referred to the Reference Committee on the Report of the President,

Dr. Frey, Chairman.

Section 5. (See 75) Address of the President-Elect

SPEAKER BAUER: Dr. Gartner, will you be a committee of one to escort the President-Elect, Dr.

Bauckus, to the platform?

(The delegates arose and applauded as Dr. Albert A. Gartner, of Erie County, escorted Dr. Herbert H. Bauckus to the platform.)

PRESIDENT-ELECT BAUCKUS: Thank you!

SPEAKER BAUER: Dr. Bauckus, your troubles are about to begin, so you might as well start them now.

Gentlemen, your President-Elect! President-Elect Bauckus: We have arrived at the 138th Annual Meeting of the Medical Society of the State of New York, not one of us but tensely conscious that a vital and greatly increased responsibility challenges the medical profession in the world of 1944. Here in the largest city of the world we meet in peace, comfort, and security, yet through the means of modern transportation we are less than a day from the most destructive war in the history of man, and within sixty hours from the once remote corners of the earth. Truly, we are close to this most terrible devastation. Today we give our service in this very city to brave men and women who tomorrow are in the peril and horror of battle far away in foreign lands; and so this once large earth has become relatively small and our task in it increasingly great. When war destroys life and happiness, the more the need for our profession to strive for human salvation, even to the mind and body of the most barbarous enemy, for the quality of mercy is an essential in the practice of medicine.

We are then clear in the concept of our part in the winning of this war for the forces of democracy and for the preservation of those fine ideals which our profession has cherished since the time of Hippocrates. May I, for the Medical Society of the State of New York, pledge our most sincere loyalty to the President of the United States, our Commander-in-Chief, and to all those of duly constituted authority

in the government of our people?

The reports of our Annual Meeting indicate that the war participation of our membership has been well planned. Over nine thousand physicians of New York State, more than a third of the total number of practitioners, have responded to the call to the colors. That they will not acquit themselves well and nobly in this great world conflict we need not fear, for we know what they are and how they have been trained. Of the great personal sacrifice they have made, and will continue to make, we cannot tell in words that can adequately display our pride and our appreciation. They will not all return, but we need them and want them back here with us again. Let us think of this as our responsibility and debt to our fellow practitioners in the military services, and let us be practical about this, too.

The problems of rehabilitation are already at hand. They extend into every aspect of our social life. They will increase as we approach the long-hoped-for

The appropriate committees of postwar period. Organized Medicine will assume their share of this burden in the great cost of war. I shall not attempt to review the many important features in our work of the past year under the faithful and able leadership of your President, Dr. Thomas A. McGoldrick. The annual reports of our many committees, the studies and recommendations by the reference committees, and the final action of this House of Delegates will bring forth much for the benefit of the people we serve in this State. I should like to call to your attention certain matters which I feel are of the utmost importance for our careful consideration, and I shall report on these in the knowledge that I really only mention them and cannot in this space of time fully discuss and analyze them. I shall presume upon you further by making these statements somewhat in the way of recommendations, in a manner of thinking out loud, so to speak.

We are an integral part of the American Medical Association. We send representative delegates to its meetings, and we are interested to see it function as a democracy. This form of government is not without its troubles, errors, and temporary failures, but it is to us the only kind worth fighting for. Loyalty, patience, study, work, and constructive criticism, too—these attributes will make us faithful members of this great educational institution. By the same token, the Medical Society of the State of New York needs, as it does its life's blood, the support and cooperation of its component county units. The thought of the community counts with values indispensable in the program for good medical care. I hope we can keep in close contact with every county society. I commend heartily as an outstanding development for good national health the estab-lishing of the new Council on Medical Service and Public Relations of the American Medical Association.

We are licensed as a profession because the people believe they can best be served when especially prepared experts minister to their needs. This license is beneficial, protective, and in a way provides restraint, but this restraint, if just, depends upon capacity and training, not on special privilege. Long has the profession struggled to secure high standards in the Medical Practice Act of the State of New York, and having attained them in our law—we have attained them-again have fought valiantly and long, and against difficult odds, to retain them, solely for the protection of the public health. Who that is ill, or responsible for the care of illness in the family, does not want the practitioner in charge to have the best skill, ability, and training possible? Who doubts the time, equipment, and personnel necessary to give this training? And yet each year legislation is introduced to allow persons untrained in the healing art, cultists and the like, to undertake to diagnose and cure human illness. Licensing these cults makes their ridiculous scientific claims more susceptible to. belief by an insufficiently educated portion of a credulous public. Some have thought that a Basic Science Law would make it more difficult for chiropractors to practice the healing art. I am opposed to the support of this proposal. In my opinion, its passage would result at once in the passage of a bill licensing chiropractors, and those already in practice would be licensed without a basic science examination. We would expect physicians already in practice to be exempted; why not others? A basic science qualification is somewhat equivalent to the first third of our medical studies; it does not embrace contact with the sick, and it is not adequate training

Mr. Speaker, I move that the reports of Officers, Council, Trustees, Legal Counsel, and District Branches that have been published and distributed to the members of the House be referred to the respective Reference Committees without reading.

DR. ROBERT BRITTAIN, Delaware: I second that motion.

... There being no discussion, the motion was put to a vote, and was unanimously carried. ... Speaker Bauer: The reports are so referred.

The tables for the Reference Committees, with the exception of the New Business Committees, are in the Manhattan Room, which is one floor below. The New Business Committees will meet in the antercom outside of this hall. The stenographers are in Conference Room 8, which is on the mezzanine floor. I believe that all committees should meet in their respective places as soon as this House recesses this noon.

Section 4. (See 75)

### Remarks of the President

Speaker Bauer: Dr. Brennan, would you be a committee of one to escort the President of the Medical Society of the State of New York to the platform?

(The delegates arose and applauded as Dr. Thomas M. Brennan, of Kings County, escorted Dr. Thomas

A. McGoldrick to the platform.)

SPEAKER BAUER: Dr. McGoldrick, we are proud to have you address us this morning, and I hope that when you conclude your remarks you will keep a seat on the platform.

Gentlemen, your President! PRESIDENT MCGOLDRICK: I have very little to say to take up your time this morning. The report for the year has been published in the Journal, and, as you just heard, has been referred to the appropriate reference committee. Since that report was published the principal action affecting the Society has been in reference to Workmen's Compensation.

The Moreland Act Commission to investigate the

workings of the Compensation Act made its report to the Governor, and on that report certain amendments were drawn up and sent, with the Governor's approval, to the Legislature, and adopted by that

body without change. .

The principal suggestion that was enacted was separating the State into two parts as far as that Act is concerned: the area of four of the five counties in the City of New York was made one and the rest of the State was made another, with different laws or amendments to the existing law for those two different parts. Throughout the State, outside of New York City, there have been practically no changes or very slight changes in the arbitration committee. In the Greater New York counties the work which has been delegated heretofore to the county societies has been taken away from them, and as the law stands now the county societies of Greater New York no longer have the power over those principal func-tions—namely, the rating of physicians in their special qualifications, the inspection and licensing of clinics for compensation work or first aid, the arbitration of disputed bills, and the investigation and trial of men qualified under the Act for violations of the Act. All of those functions have been taken by law away from the county societies in the Greater New York area, and have been taken over by the industrial Commissioner through a different organization.

It is expected that, because of the enormity of the work, the county societies will, on invitation of the Commissioner, do some of the rating. The Commissioner has really expressed his wish for that, and I am sure that every contribution which the county societies and the State Society can make to the successful administration of the law will be made, regardless of the feelings or wishes of the members thereof. It is the law, and while many of us do not like what has happened, nevertheless it will be carried out, I am sure, and offers have been made to the Commissioner and to the Governor of complete co-

operation.

voluntary, prepayment insurance for the cost of medical care. As Chairman of the Subcommittee I have prepared an extended annual report on the subject, which is at the disposal of the Reference Committees and this House of Delegates. Therein I have given reasons for the establishment of a competent bureau with director and personnel so that our Society can assume its proper role in the provision for medical care costs. We now have the experience that will enable us to advance. The people of this intelligent and produce that the control of the contr intelligent and modern State deserve the opportunity to procure for themselves this kind of insurance for their personal health. Participation in these plans is a great education in the responsibility of the individual to think about health and to prepare for the prevention of disease. There has been much talk about the cost of medical care being a deterrent to early diagnosis and treatment, but it has been well said that of man's miraculous mistakes, procrastination bears the palm. Let us also not make the mistake of procrastination in this vital question of the hour.

I should like to call your attention to that portion of the report dealing with the respective fields of hospitalization and of medical care insurance. At this time I am pleased to report the formation of the United Medical Service, Inc., an announcement which may be of great significance to people in the

metropolitan area.

The new company is a consolidation of the Community Medical Care and the Medical Expense Fund and, like its predecessor companies, is a nonprofit organization engaged in providing prepaid medical insurance for the middle- and lower-income groups of the seventeen lower counties of New York State. The new company, I hope, will be approved by the Medical Society of the State of New York, and it is expected that similar endorsements will be forthcoming from all of the county medical societies in which the company is licensed to do business.

It has long been clear to most students of the

problem that no voluntary insurance plan to provide adequate medical service for the lower- and intermediate-income groups can succeed in any important way without the full cooperation of the medical profession. It has also been equally clear that policies providing for the payment of doctors' bills should be offered to the public in conjunction with policies providing for hospital bills. Accordingly, accredited representatives of the medical profession and the Associated Hospital Service of New York have met on frequent occasions during the past eighteen months to work out plans which would embrace these two requisites. The result of these deliberations is the creation of United Medical Serv-

The new company has been assured of the active cooperation of most practicing physicians in the seventeen lower counties of New York State, and it is expected that in due course reciprocal arrangements will be made with the doctors practicing in the neighboring communities of New Jersey and Connecticut. The United Medical Service will also enjoy the benefit of the experience of the actuarial and administrative staff of the Associated Hospital Service, which at present has outstanding some 1,500,000 contracts for hospital insurance under the well-known three-cents-a-day plan. It will now be possible to offer to the public a combination hospital and medical insurance contract through the agency of a single sales organization.

The management of the United Medical Service will be in the hands of a board of trustees composed of distinguished members of the medical profession

and public-spirited laymen who have devoted much time and thought to the complicated questions involved in launching a sound plan for this purpose. The objective of the company is to provide a method by which the lower- and middle-income groups can receive adequate medical service in hospital, office, or home at the lowest possible cost consistent with sound medical practice. Nevertheless, the trustees have well in mind that too impetuous steps, even in pursuit of t' n disaster if undertaken The management, there: near future a medical contract which will provide for the payment of doctors' bills resulting from so-called catastrophic illnesses, such as surgical and obstetric care. and for illnesses requiring prolonged hospitalization. Concurrently, studies will be continued in the hope that as promptly as possible these benefits will be increased to the end that eventually all medical services can be included.

We have the commanding support and wisdom of many respected citizens in our efforts to create sound

voluntary medical care plans, What of the Wagner-Murray-Dingell bill proposed under a social security label? By what right do the sponsors of such legislation designate as social security an experiment calling for a sudden revolution in established medical practices? physicians certainly do not consider it health security, and it is we who have persisted for the high standards and incomparable health statistics we now

enjoy—and that is a known security. It is unfortunate that the leaders of labor seem willing to so soon forsake our proved care for this will-o'-the-wisp, for I believe we still are, and always will be, the most practical and understanding friend of the laboring man and his family; and I feel that most workers will agree with that suggestion. The relations of cause and effect in health and in sickness over the long-range view are difficult to analyze and understand. It has been said that the soldier of today is pushed to destruction by hands that long ago were dust. The same thought applies to devastation by disease.

I am deeply grateful for " upon me by my election to . I am most appreciative of

ing me to follow in the footsteps of so many brilliant and outstanding leaders. With your further indulgence, I close with this bit of good advice to this Medical Society and to all other societies. It comes from the Good Book (First Book of Kings): "If thou wilt be a servant unto thy people this day, and will serve them, and answer them, and speak good words to them, then will they be thy servants forever." (Applause)

SPEAKER BAUER: Thank you, Dr. Bauckus! The remarks of the President-Elect are referred to the Reference Committee on the Report of the President, Dr. Frey, Chairman.

Dr. Bauckus, will you not remain on the plat-

There are a number of Supplementary Reports which have been turned in, and which have been mimeographed and distributed. You will find them in your seats. If any of you do not have them, there are extra copies here on the table.

Section 6. (Sec 38)

Supplementary Report of Council-Part I: Postgraduate Education

In addition to the postgraduate instruction mentioned in the Annual Report of the Council Com-

to practice any healing art in any civilized country, yet those who possess the certificate could practice to cure illness. We, as a medical society, cannot afford to advocate lowering in any way the standards for the practice of medicine in New York State. I believe that the Board of Regents and all those in official authority would be much disappointed if we took any other step. As for the procedure under the proposed law, if I were a chiropractor, and were hauled into court for practicing the healing art without a basic science certificate, I would simply say that I am practicing chiropractic and not the healing art; and I would be telling the truth, too, and you would have to back me up on that.

We have in our Medical Society a marvelous committee for the continual postgraduate instruction of our membership throughout the State. Through these programs and our publications, our physicians everywhere have access to the most modern procedures in medical practice. We are greatly indebted to the Department of Health of the State of New York for their very practical aid in these ventures for the good of the public health. In the final analysis, we are counted and are weighed, and we are loved and respected—first things first—according

to our ability as physicians.

There are three very distressing plagues in the Empire State. They are cancer, tuberculosis, and mental illness. The State actively opposes their costly ravages. The cost to properly control and care for them would be tremendous in money, but what they cost in suffering, hardship, and death, and how far they extend their sadness into the life circle of all of us, no tongue can tell. The State must do more, our county medical societies must do more, to take care of these diseases. Tuberculosis is a preventable disease, a curable disease; it is a contagious disease—why do we put up with it? It was Ben Jonson who said, "The King who makes war on his enemies tenderly, distresses his subjects most cruelly."

Tuberculosis, contracted as a contagious disease in our midst, should be cared for in our sanatoriums without charge to the patient. This is an obligation of modern society, and in the end will save money for the State of New York. We need to do this to con-

quer tuberculosis.

Our Society has an important contribution to make in the establishment and administration of a sound school child-health program in New York

I should like to call attention to the very comprehensive report of our new Planning Committee for Medical Policies. Its recommendations reflect extended study and research. The work of the Com-

mittee should be continued.

The nursing profession is, of course, closely related to the practice of medicine. Nursing has its economic problems for the patient as well as for the nurse. There is a serious shortage of adequately trained nurse personnel. It is in times such as these that the great skill and resourcefulness of a good nurse attract public appreciation. Her financial compensation, when compared to present wage standards, seems entirely too small. Hospitals and the lower-income patients need her desperately, and to this pressing call she often responds at great personal sacrifice. The heroism of our nurses working in the danger and horrors of war on land and sea and in the air is commonplace—a magnificent tribute to a noble profession.

Scientific discussions and frequent meetings with our specialist fraternity, the dentists, are a necessity in intelligent health planning. The dental problems of the child in school call urgently for practical solution.

We were most fortunate when the Woman's Auxiliary to the Medical Society of the State of New York came into being. It was expected that this organization would be a gracious and charming addition to our State, District Branch, and local county meetings; but an equal worth of this organization soon became apparent in the legislative understanding and high-principled interpretation it brought to our Society. The Council has authorized a Committee to meet regularly with the officials of the Woman's Auxiliary.

The E.M.I.C. program came upon us directly during the year. Our Public Health and Education Committee, with the sympathetic cooperation of the New York State Department of Health, has disposed of its many details in a most satisfactory manner. Time may allow its further perfection. In the meantime, the profession is giving its best to the mothers and infants designated in this military pro-

gram.

The questions of medical relief are still important. The statement is often made that the very poor receive the best of medical care. This is inaccurate. It is more correct to say the welfare group should have the best of medical care. We are making real progress with Boards of Social Welfare groups in this regard.

Recently the government of New York State has made many laudable advances into the fields of medical care for the benefit of its citizens. Some of these plans may be new and far-reaching. They require careful study and sincere evaluation, and under these conditions much good will come to medicine. We will cooperate to the full in the development of sound health programs. No one knows better than physicians that human beings have minds we must consider, and that the personal contact is ever an integral part of the practice of medicine.

In the past year we have had new laws affecting medical practices in the Workmen's Compensation Act. They are designed to effect improvement, and they should receive our most studious support.

The Workmen's Compensation Commission, no doubt, is cognizant that the medical profession of the State must faithfully do its part if the working man and woman are to enjoy to the full the advantage of good industrial health. The worker needs to know that he is receiving the quality of medical care purchasable under a reasonable fee schedule. He is paying for that. This means, too, a literally true, free choice of his physician by himself.

There is great need for further advance in the prevention of industrial disease. The physicians of our state, all of them, including those of highest standing, must attain an undiscouraged interest in caring for the health problems of the industrial worker.

For these reasons, and any other, this Medical Society should participate with full accord in the Workmen's Compensation Act. In my opinion this large and expanding field requires the employment of a competent and experienced state-wide director with adequate personnel and equipment. This I stress, not for the economic advantage to us in maintaining a just fee schedule, but because it is, especially in this period of war production, an obligation we owe to the busy men and women at the home front. "Keep Them Fighting" is a good war slogan.

Since 1938 this Society has studied nonprofit,

1353

voluntary, prepayment insurance for the cost of medical care. As Chairman of the Subcommittee I have prepared an extended annual report on the subject, which is at the disposal of the Reference Committees and this House of Delegates. Therein I have given reasons for the establishment of a competent bureau with director and personnel so that our Society can assume its proper role in the provision for medical care costs. We now have the experience that will enable us to advance. Section 6. (See 38)

Supplementary Report of Council—Part I: Post-graduate Education

In addition to the postgraduate instruction mentioned in the Annual Report of the Council Committee on Public Health and Education submitted on March 1, 1944, postgraduate instruction has been arranged for the following county medical societies:

The Committee arranged for postgraduate instruction to be presented in twenty-seven counties with a total of ninety-six lectures, sixty-eight of which were provided jointly by the Medical Society of the State of New York and the New York State Department of Health.

A request for instruction has been received from the Chemung County Medical Society. As soon as subjects and speakers have been decided upon, final

arrangements will be completed.

The Council Committee on Public Health and Education and the New York State Department of Health are making a special effort to present to the medical profession the very latest information regarding penicillin therapy. Preceding the announcement of postgraduate instruction to be offered and the speakers available, a one-day speakers' conference was held in the Library of the State Laboratory in Albany on April 26, 1944. Many of the leading authorities in this field addressed the group and an outline will be prepared from these presentations to be used by the lecturers who will address county medical societies.

As a part of the Home and Farm Safety Program, the Medical Society of the State of New York and the Division of Public Health Education of the New York State Department of Health have designated a group of physicians to discuss subjects relative to the medical and surgical care of home and farm accidents at meetings of county medical societies and other medical groups. Preceding the announcement of this instruction and the speakers available, a speakers' conference was held in New York City on May 10, 1944, for the purpose of organization.

Section 7. (See 52)

# Supplementary Report of the Council—Part IV: Public Health Activities

Blood and Plasma Exchange Banks.—The following is a statement submitted by the New York State Department of Health regarding the Department's plan concerning the "recommendations" prepared by the Subcommittee on Blood and Plasma Exchange Banks:

"The New York State Commissioner of Health has advised the Council Committee on Public Health and Education that he has been giving very serious consideration to the recommendations of their Subcommittee on Blood and Plasma Exchange Banks as published December 1, 1943. The State Department of Health regards the establishing of an adequate civilian supply of whole blood, blood plasma, and other blood substitutes as a proper responsibility and is anxious to develop a program for this service. Due to the nature and complexity of the problems that must first be solved and the pressure of other matters, it was impossible to develop plans in time for submission to the 1944 Legislature. It is fully expected, how-ever, that such plans will be presented in 1945, and steps are being taken at the present time to try to locate the properly trained personnel to develop

plans which will embrace collection, preparation, and distribution on an equitable basis and in such a manner as to supplement rather than supplant existing facilities where they are adequate and operating in accordance with high standards."

Copies of this statement were mailed to members of the Subcommittee on Blood and Plasma Exchange Banks.

Section 8. (See 72)

# Supplementary Report of the Council—Part IX: Workmen's Compensation

In the report of the Council Committee on Workmen's Compensation published in the JOURNAL of April 1, 1944, page 763, there appears a statement to the following effect:

"On June 11, 1943, your Committee reported to the Council that Attorney General Nathaniel L. Goldstein had rendered an opinion on May 4, 1943, that the Medical Society Compensation Boards were authorized under the Civil Practice Act, Sections 406 and 358, to subpoena witnesses and to render the oath to witnesses. The same opinion indicated that such authorization is not contained in Section 13-d of the Workmen's Compensation Law itself (as amended in 1935). On the basis of this decision, the medical societies have proceeded with the investigations and hearings of physicians charged with violations of Section 13-d of the Workmen's Compensation Law."

In amplification and explanation of this Section we wish to point out that the first release to the press concerning physicians involved in the "kickback" practices appeared on April 3, 1943. Immediately thereafter your Director conferred with the Acting Industrial Commissioner and his deputies concerning the steps to be taken by the medical societies to hear the accusations of the Moreland Act Commissioners against the physicians named.

It was agreed at that time that the Industrial Commissioner, through his deputies, would proceed against the more flagrant offenders named by the Moreland Act Commissioners, and the medical societies would also simultaneously begin proceedings against the other physicians so that the burden of hearing and trying the large number of physicians involved would be shared both by the Labor Depart-

ment and the medical societies.

Your Director, or another representative of the medical societies, attended all of the hearings held by the Deputy Commissioners of the Labor Department. (About thirty hearings and trials were held until the proceedings were stopped by Supreme Court decision on September 8, 1943, after which all those physicians' cases were referred back to the medical societies for action.) At the same time your Director arranged the procedure to be followed by the Compensation Boards of the county societies, in fulfilling their functions under Section 13-d.

At once legal difficulties arose, because the medical societies, up to that moment, on information previously received from proper authorities in the Labor Department and through their own Counsel, were of the belief that they did not possess the power of subpoening witnesses or rendering the oath to witnesses, either physicians or laymen. It was apparent, from the beginning, that it would be necessary, in order to substantiate charges against the physicians named, to subpoena lay witnesses as well as physicians and put them under oath, and that in many instances the books and records of both laymen and

physicians would have to be subpoenaed. Therefore, on April 26, 1943, your Director, after conferences with the Acting Industrial Commissioner and his deputies, addressed a communication to the Acting Industrial Commissioner, Mr. Michael J. Murphy, setting forth the legal problems facing the medical societies under the limited jurisdiction possessed by them to participate to the fullest extent in the investigations and trials, and asking for an immediate opinion by the Attorney General on the legal questions involved. Our letter in full is available.

On May 19, 1943, the Industrial Commissioner answered the above letter by enclosing a copy of an opinion handed down by the Attorney General, Nathaniel L. Goldstein, which opinion is available on call.

Upon receipt of this opinion the medical -ocieties proceeded at once with hearings of the doctors whose names appeared on lists released from time to time by the Moreland Act Commissioners. The last of these lists of physicians was not obtained by us until January 11, 1944. In the interim nearly all the physicians whose names appeared on the first lists submitted in the spring and early summer were heard by the societies and either admitted or denied their guilt. It was arranged that those who denied their guilt would be placed on formal trial as soon as all the physicians named had an opportunity to be heard in preliminary hearings.

During this period your Director conferred frequently with the Chairmen of the various Workmen's Compensation Committees and meetings were arranged with them and with the Industrial Commissioner and his deputies to develop a more or less uniform method of procedure, and, if possible, to agree upon a more or less uniform method of recommending to the Industrial Commissioner the degree of discipline to be meted out to those found guilty. All of this was done without undue delay, considering the numerous legal questions raised by the Counsel for the Society and others as to the authority of the medical societies to act under the provisions of Section 13-d. After, for example, New York County had heard practically all the physicians named on the initial list, the question was raised by the Counsel as to the propriety and legality of the Workmen's Compensation Board's acting unless charges were first preferred by the Industrial Commissioner, the Workmen's Compensation Board of the Society then acting as a court and making recommendations to the Industrial Commissioner as to punishment of those deemed guilty.

It was not until April 6, 1944, that these formal charges were made by the Industrial Commissioner against all the physicians named by the Moreland Act Commissioners, against many of whom the county societies had already taken preliminary ac-

In accordance with the agreement made between the medical societies and the Industrial Commissioner, recommendations for punishment were necessarily delayed until the various procedural and legal difficulties were cleared up and until the medical societies had, by holding a large number of preliminary hearings, gotten a clear perspective of the magnitude of the problem before them and the degree of guilt, if any, of the numerous physicians named.

It can be definitely stated, in view of the large number of physicians involved, that the medical societies have acted promptly and courageously. The fact that the medical societies were charged by the Moreland Act Commissioners in the public

press did not serve in any way to enhance the procedure or to stimulate the medical societies to prompter action, but confused the issue. In any event, the record above will show with what dispatch and thoroughness the societies acted in the face of an unprecedented volume of work and without adequate authority, funds, or personnel at the time the original charges were made.

HARRY ARANOW, M.D., Chairman

Section 9. (Sec 58)

Supplementary Report of Council-Part X: Medical Licensure

Since filing the Annual Report, the suggested changes in Section 32, Subdivision 2C of the Regulations of the Commissioner of Education with respect to the special requirements in licensing examinations in medicine were turned down completely. Chairman of the Committee of Licenses of the Board of Regents, in reviewing the question, commented after reading the law "that the Department is not obliged to give more than two examinations. The law says that an applicant shall pay \$25 for the first examination and a second examination may be given without fee; but the law makes no suggestion for a third or other examination. However, since the Department has established a precedent of giving more examinations, it probably cannot discontinue giving them." It does, nevertheless, charge the full fee of \$25 for every succeeding examination after the second.

The Council has since received the following communication from the Commissioner of Education under date of March 20, 1944:

'Some time ago you forwarded to me two resolutions adopted by the House of Delegates of the Medical Society of the State of New York having to do with the licensure of physicians in the State. The first resolution urged the Board of Regents to refuse to admit to examination for licensure any graduate of a foreign medical school 25 per cent of whose graduates taking the examination during the past ten years have failed to pass. The second resolution urged the Board of Regents to limit definitely to three in all the number of examinations which may be taken by any candidate for licensure to practice medicine in the State.

"These resolutions have been given thorough consideration by the Department and by the Board of Regents and I believe at least one conference has been held on the subject involving representatives from the Board of Regents, the

Department, and the Medical Society.

'Counsel for the Department has ruled that it would be illegal for the Board of Regents to refuse to admit to the medical licensing examination a graduate of a foreign school 25 or more per cent of whose graduates taking the examination during the past ten years have failed to pass, if such a candidate has met the requirements for admission. Counsel has also ruled that it would be illegal for the Board of Regents to limit to three in all the number of examinations which may be taken by any candidate for licensure to practice medicine in the State. The ruling of the Counsel is based upon the consideration that when a candidate has met the requirements for admission to the licensing examination he is eligible to take the examinations and that the Regents may not exercise discretionary power. "The Board of Regents wished me to express our

appreciation for your continued interest in medical education and licensing in the State."

The decision is, of course, a great disappointment to the Council and the Committee on Medical Licensure. It leaves and suggests only one recourse: Change the law. Accordingly, the Executive Officer and the Chairman of the Medical Licensure Committee have been instructed by the Council to meet with Commissioner Miller and Counselor Brind to draft amendments to the law in regard to (1) the number of examinations and (2) citizenship. These will be introduced at the next session of the Legislature after approval by the Council.

Section 10. (See 59)

# Supplementary Report of Council—Part XII: War Participation

Remission of State Assessments for Members Discharged from Service.—The Council received a request from a county society as to how best the matter could be managed of deciding which members leaving the service should have remission of dues and State assessments and which should be expected to pay dues and State assessments. The Council went on record as follows and directed that this information be transmitted to the county medical societies:

"Any member serving more than sixty days in the armed forces is entitled to remission of dues for the year in which service is rendered. If he serves sixty days or less he is not entitled to remission of dues, and if his dues were previously remitted that action shall be revoked.

"A member discharged from the armed forces after more than sixty days of service shall have his dues remitted for the calendar year in which he was discharged regardless of the month; however, unless he has served a total of at least fourteen months he shall not be entitled to remission of more than one year's dues."

Procurement and Assignment of Nurses.—The Council received a request from the Procurement and Assignment Committee of the New York State War Council for Nurses for aid through the county societies in the work of that Committee. On April 13, 1944, the Council went on record as recommending that the county societies receive nurse representatives of the Committee and discuss with them local conditions in the effort to aid nurse procurement and assignment.

(This was made the subject of a memorandum from the main office to the county societies.)

Section 11. (See 59)

# Supplementary Report of Special Committee on Office Administration and Policies

The Special Committee on Office Administration and Policies recommends that the House of Delegates continue this Special Committee working under supervision of and reporting to the Council, and that the House give the following directive as to continuance of its personnel in keeping with the action of the House in 1943:

"The Committee on Office Administration and Policies shall consist of the General Manager, the Business Manager of the Journal and Directory, the literary editor, the Treasurer, and one member of the Board of Trustees to be appointed by the President of the Society, after consultation with the chairman of the Board of Trustees."

Section 12. (See 36) .

# Supplementary Report of Special Committee on Publication

The Special Committee on Publication recommends that the House of Delegates continue this Special Committee of the Society working under supervision of and reporting to the Council, and that the House give the following directive as to the continuance of its personnel in keeping with the action of the House in 1943:

"The Committee on Publication shall consist of the General Manager, the Treasurer, the Director of the Public Relations Bureau, the literary editor, and one trustee, who shall be chairman; the trustee to serve shall be selected by the Chairman of the Board of Trustees, and the literary editor shall be selected by the Committee on Publication at its first meeting after this meeting of the House of Delegates, the former literary editor not voting. This is deemed to be the most satisfactory way to choose the incumbent of this position, who thereupon becomes a member of the Committee, because of the familiarity of the Committee with the duties involved and the qualifications necessary for the satisfactory performance of them."

Speaker Bauer: Does anyone desire that these supplementary reports be read?

CHORUS: No.

Speaker Bauer: They have been distributed, and you can look them over at your leisure. If there is no objection, the Chairman will refer them as follows: Postgraduate Education—to the Reference Committee on Report of Council, Part I, Dr. Andresen, Chairman; Public Health Activities—to the Reference Committee on Report of Council, Part IV, Dr. Hayward, Chairman; Workmen's Compensation—to the Reference Committee on Report of Council, Part IX, Dr. Simpson, Chairman; Medical Licensure—to the Reference Committee on Report of Council, Part X, Dr. Dattelbaum, Chairman; War Participation and General Matters—to the Reference Committee on Report of Council, Part XII, Dr. Mellen, Chairman; Special Committee on Office Administration and Policies—to the Reference Committee on Report of Council, Part XII, Dr. Mellen, Chairman; Special Committee on Publication—to the Reference Committee on Report of Council, Part VI, Dr. Rawls, Chairman.

Hearing none, it is so ordered.

# Section 13. (See 60, 76) Constitution and Bylaws Amendments

There have been several amendments which were proposed last year, and the Chairman did something a little unprecedented in regard to them in that heretofore it has never been the policy to refer amendments to the Constitution and Bylaws to a Reference Committee, but have them taken up directly in the House. This year I felt it would be better to refer them to a Reference Committee, for the reason that two amendments are based on the same subject—namely, the question of apportionment of delegates, and neither one of the amendments which have been submitted is in language which could possibly be adopted, so they would require considerable discussion. Therefore, it was felt that this could be done better in a reference committee, so the amendments have been referred to Reference Committee.

The first proposed amendment reads:

"Whereas, the recently enacted reapportionment bill is based upon the population ratio and will thereby cause a redistribution of delegates from the component medical societies to the House of Delegates to the Medical Society of the State of New York; therefore be it

"Resolved, that the number of delegates from any component medical society be not reduced from their present number unless there has been a material reduction of the number of physicians in

the area of any county medical society,

and it is meaningless because it does not say what is a material reduction.

The next proposed amendment on the same subiect is:

"Each component county society shall be entitled to elect as many delegates as there shall be State assembly districts in each county at the time of the election, but each component county medical society shall be entitled to elect at least one delegate''

and this one is also meaningless because it does not

say what ratio or proportion is necessary.

Therefore these amendments have been referred to a Reference Committee on Constitution and By-laws, of which Dr. Frederic W. Holcomb is Chair-

There is another amendment on the question of travel expenses of the delegates to the American Medical Association. That has been referred to the

same committee.

There were two amendments which referred to the setting up of a Medical Benevolence Fund. were introduced two years ago, were withdrawn last year, and were reintroduced. I understand that the gentleman who introduced these amendments last Year wishes to withdraw them. Is that true?
DR. GEORGE W. KOSMAK, New York: Do you

want me to do that now?

SPEAKER BAUER: Yes.
DR. GEORGE W. KOSMAK, New York: I should like the permission of the House to withdraw these

amendments Speaker Bauer: Dr. Kosmak requests permission to withdraw these two amendments pertaining to the setting up of a Medical Benevolence Fund.

Having been introduced before the House, they can only be withdrawn with the consent of the House. Is there any objection to their being withdrawn?

(None was expressed.)

SPEAKER BAUER: The Chairman hears none.

They are, therefore, withdrawn and will not be

referred to a Reference Committee

The Reference Committees will all meet in the Manhattan Room, with the exception of the Reference Committees on New Business, who will meet in the anteroom. I suggest that all Reference Committees meet promptly as soon as the House recesses, because we are very anxious that none of you should be absent from the House for the afternoon ses-

We have set that farther on by half an hour than usual so as to give the Reference Committees a little more time. The House, when it does reconvene, will do so at 3:30 instead of at 3:00 o'clock.

At this time I might state that in accordance with the Bylaws the Speaker makes up a schedule of the adjourned sessions of the House, which has been published. The House has a right to amend those if it sees fit.

Section 14

Approval of Proposed Time Schedule of House of Delegates

SPEAKER BAUER: To refresh your memory, the House will reconvene at 3:30 this afternoon, will meet again at 9:00 o'clock tomorrow morning, and at 1:00 o'clock tomorrow afternoon. Does anyone wish to make any alteration in that schedule?

(There was no response.)
SPEAKER BAUER: If not, that schedule will

stand as published.
All of those who have an interest in any of the resolutions which will be presented or in any of the reports which have been presented and/or printed and distributed should seek out the proper Reference Committee and state your views before them.

Section 15

Introduction of Representatives from Other State Societies

SPEAKER BAUER: I know there is a delegate here from New Jersey. Are there any delegates from Connecticut or Vermont?

(There was no response.)

SPEAKER BAUER: Apparently not. If anyone hears of a delegate from either one of those states being present, I wish he would inform the Speaker.

We are honored this morning by having with us not only a delegate from our neighboring State of New Jersey, but the President of the New Jersey State Society. Dr. Kenney, will you present Dr. Joseph F. Londrigan, President of the Medical Society of New Jersey?

(The delegates arose and applauded as Dr. J. Stanley Kenney, of New York, escorted Dr. Joseph F. Londrigan to the platform.)

SPEAKER BAUER: I am going to ask Dr. Londri-

gan to say a few words to you.

We are very glad indeed to have you here, not only to represent your Society, but particularly because of your prominence in it.

Dr. Joseph F. Londrigan: Thank you!

I shall be extremely brief in my remarks. Mr. President, Mr. President-Elect, Mr. Speaker, and Members of the House of Delegates of the Medical Society of the State of New York, it is indeed a pleasure to bring to you greetings from the State of New Jersey. If there ever was a time when unity should be the watchword of Organized Medicine, that time is now.

New Jersey joins with New York in support of our parent organization, the American Medical Association, to maintain and keep inviolate the American

way of practicing medicine.

The wish from the State of New Jersey to you, this House of Delegates, is that you will have a most successful session.

I thank you! (Applause)
SPEAKER BAUER: Thank you, Dr. Londrigan! I understand there are some guests here from the State of Wisconsin. Will they please arise?

(Five delegates from the State of Wisconsin arose

amid applause.)

SPEAKER BAUER: We are very glad to have you here, gentlemen, and I hope you will be with us throughout this meeting. I shall be glad to extend the privilege of the floor at any time to you.

SPEAKER BAUER: Dr. Londrigan, are there any

other delegates here from New Jersey?

Dr. Londrigan: None that I know of.

Speaker Bauer: The Chairman will now receive resolutions.

Section 16

Constitution and Bylaws-Proposed Amendment to Article XI, Section 1-Action Delayed One Year

Dr. W. G. COOPER, St. Lawrence: At the annual meeting of the St. Lawrence County Medical Society held at Potsdam, November 11, 1943, the following motion was carried:

"That the President appoint a committee consisting of two delegates and two other members to proceed with the movement to bring about a transfer from the Fourth to the Fifth District Branch."

Accordingly, we suggest the following amendment to the Constitution of the Medical Society of the State of New York:

"Article XI, Section 1, shall be amended so that there be deleted from the fourth paragraph the name 'St. Lawrence;' and so that there be added to the fifth paragraph the name 'St. Lawrence.' These paragraphs would then read:

'The Fourth District Branch shall comprise the members of the Medical Societies of the Counties of Franklin, Clinton, Essex, Hamilton, Fulton, Montgomery, Schenectady, Saratoga, Warren, and Washington.

'The Fifth District Branch shall comprise the members of the Medical Societies of the Counties of Onondaga, Oneida, Herkimer, Oswego, Lewis, Madison, Jefferson, and St. Lawrence."

SPEAKER BAUER: This being an amendment to the Constitution, no action is required on it at this time, but it will remain in the hands of the Secretary and be acted on next year after publication.

Section 17

(Resolution presented by Dr. Heyd, which was in Executive Session, withdrawn.—Secretary.)

SPEAKER BAUER: Are there any other resolutions?

Section 18. (See 44)

#### Women Medical Students and Interns

DR. EMILY D. BARRINGER, New York: I should like to present the following resolution:

"Whereas, the Medical Society of the State of New York has had the vision and courage to endorse and expedite the securing of commissions in the Medical Corps of the Army and Navy for women physicians; and

"Whereas, the satisfactory commissioning of women physicians in the Medical Corps depends on a supply of well-trained applicants; and

"WHEREAS, the premedical and medical education of women physicians has been seriously affected by the accelerated medical educational program of the Army and Navy, in which the best interests of the women physicians have been ignored, and there is no national standardization in regard to the status of the woman medical student, she being in the position of the proverbial stepchild, while the man medical student is receiving every educational and monetary consideration from the government; and

"Whereas, the woman physician is held equally responsible in the eyes of law, because the same license to practice medicine is issued to her as to

her brother colleague; therefore be it "Resolved, that the Medical Society of the State of New York appoint a special committee to study the problem of the status of the woman medical student and intern; that this committee be in-

structed to evaluate the many difficulties of the problem, and have power to act to correct them; further, that on this committee there should be at least two women physicians who are known to be vitally interested in the matter, and that one of these women should be the incoming President of the American Medical Women's Association, who is a member of our Society."

SPEAKER BAUER: That is referred to the Reference Committee on New Business B, of which Dr. Eggston is Chairman.

Section 19. (Sec 46)

Noninclusion of X-Ray and Anesthesia in Any Hospital Service Plan

Dr. Thurber LeWin: I am instructed by the Medical Society of the County of Erie to present the following resolution:

"Whereas, a motion was made, seconded, and carried that the Medical Society of the County of Eric solicit the aid of the State Society against the inclusion of x-ray and anesthesia in any Hospital

Service Plan; therefore be it "Resolved, that the State Society establish a definite stand on this matter."

SPEAKER BAUER: That is referred to the Reference Committee on New Business C, of which Dr. Kenney is Chairman.

Section 20. (See 54)

Special Membership Fee for Interns and Residents

DR. THURBER LEWIN: This is also being introduced upon the instruction of the Medical Society of the County of Erie:

"WHEREAS, it would be in the best interests of the younger men to join the State Society; therefore be it

"Resolved, that interns and residents in hospitals be permitted to join the organization at a reduced fee ''

SPEAKER BAUER: That is referred to the Reference Committee on New Business A, of which Dr. Carroll is Chairman.

Section 21. (Sec 49)

#### 1945 Meeting Invitation to Buffalo

DR. THURBER LEWIN: This is the third resolution being introduced upon instruction of the Medical Society of the County of Erie:

"Whereas, the 1943 Annual Meeting of the Medical Society of the State of New York was a

great success in Buffalo; and
"Whereas, Dr. Herbert H. Bauckus, your
President-Elect, is a Buffalonian; and
"Whereas, the Medical Society of the County
of Erie would deem it an honor and privilege to have its colleagues convene there again; therefore be it

"Resolved, that the Medical Society of the County of Eric extend an invitation to the Medical Society of the State of New York to hold its 1945 Annual Meeting in Buffalo." SPEAKER BAUER: That is referred to Reference

Committee on New Business C, of which Dr. Kenney is Chairman.

Section 22. (See 39)

United Medical Service

Dr. Benjamin M. Bernstein, Kings: This is a resolution concerning the United Medical Service:

"WHEREAS, the United Medical Service has been organized by a merger of the Community Care Plan and the Medical Expense Fund of New York; and

"Whereas, it is urgent that a plan for health insurance which would be workable and salable as well as equitable both to the doctor and the public

be put into operation without further delay; and "WHEREAS, the rapid sale of this plan to a large number of subscribers will be of enormous value in counteracting the attempts being made by government to control the practice of medicine;

"Whereas, the United Medical Service is a plan for health insurance entirely under control of

the medical profession; and

"WHEREAS, this plan has an adequate amount of cash on hand to pay the bills for medical care;

"WHEREAS, this plan does not ask the doctor to contribute to the financial setup or for the carrying

on of its activities; and "Whereas, it is for the benefit of the physician as well as the patient that the provisions of this plan provide for free choice of physician without the restrictions imposed by a panel system; therefore be it

"Resolved, by the House of Delegates of the Medical Society of the State of New York in convention assembled on May 8, that it does hereby approve the plan of United Medical Service; and

be it further "Resolved, that it urges every practicing physician in the seventeen counties governed by the scope of the plan to give it their whole-hearted support and signify his or her willingness to serve in accordance with the provisions of the plan as soon as support is formally requested."

SPEAKER BAUER: This is referred to the Reference Committee on Report of the Council, Part VII, of which Dr. Gartner is Chairman.

Section 23. (See 41)

Establishment by American Medical Association of Section on Industrial Medicine

Dr. Benjamin M. Bernstein, Kings: This is the second resolution I have to present:

"Whereas, there is at present in operation a Council on Industrial Health of the American Medical Association; and

"Whereas, industrial medicine is becoming of increasing importance to the entire medical pro-

fession; and

"Whereas, the subject of industrial medicine as a specialized study ought to be encouraged and stimulated both in graduate and undergraduate

medical training; and "Whereas, a forum for the exchange of ideas and projects and methods and progress ought to be provided on a national scale; therefore be it "Resolved, that the Medical Society of the State

of New York request the American Medical Association to establish a Section on Industrial Medicine."

SPEAKER BAUER: That resolution is referred to the Reference Committee on New Business B, of which Dr. Eggston is Chairman.

Section 24. (See 55)

Establishment by County Societies of Committees on Health Education

DR. BENJAMIN M. BERNSTEIN, Kings: This is the third resolution:

"Whereas, the education of the public in health matters is of the utmost concern to the organized medical profession; and

"Whereas, the means and methods to be pursued in carrying on the education of the public ought to be and remain in the control of the county and state societies; therefore be it

"Resolved, that the Medical Society of the State of New York urge each county society to establish a Committee on Health Education either as a separate committee or as a subcommittee of the Committee on Public Health, in order to effectively carry on this very important adjunct of medical practice."

SPEAKER BAUER: That is referred to the Reference Committee on New Business A, of which Dr. Carroll is Chairman.

Section 25. (Sec 47)

#### Recruitments for New York State Guard

DR. LAURANCE D. REDWAY, Westchester: May I bespeak the sympathetic listening to the reading of the following resolution on the part of this House:

"Whereas, the New York State Guard is seriously in need of officers as well as enlisted personnel, medical as well as line; and

"WHEREAS, the existence of the New York State Guard is required by the Constitution of the

State; and

"WHEREAS, more and more Federal troops are removing from the area of the continental United States, and thereby the State Guards of all states become of greater importance as the first line of defense in any internal disturbance, be it from Fifth Column activities or the disasters of nature:

be it "Resolved, that the Medical Society of the State of New York urges every physician in New York State to apply immediately to his nearest unit of the New York State Guard to ascertain whether or not his services are needed; and be it further

"Resolved, that every physician in the State of New York contact as many individuals as possible in his territory between the ages of seventeen and fifty-five with the view of urging them to enlist immediately in the Guard for training in either medical or line-troop duty."

SPEAKER BAUER: Referred to the Reference Committee on New Business C, of which Dr. Kenney is Chairman.

Section 26

Constitution and Bylaws-Proposed Amendment to Chapter XVI, Section 2-Action Delayed One

Dr. George W. Kosmak: This is a proposed amendment to the Bylaws, Chapter XVI, Section 2, to read as follows:

"All papers read before the Society at its Annual Meeting by its members shall become the property of the Society, but shall not be accepted neces-sarily for publication in the New York State JOURNAL OF MEDICINE unless approved by the Editor responsible for this function.

SPEAKER BAUER: This being an amendment to

Section 16

Constitution and Bylaws-Proposed Amendment to Article XI, Section 1-Action Delayed One Year

Dr. W. G. COOPER, St. Lawrence: At the annual meeting of the St. Lawrence County Medical Society held at Potsdam, November 11, 1943, the following motion was carried:

"That the President appoint a committee consisting of two delegates and two other members to proceed with the movement to bring about a transfer from the Fourth to the Fifth District Branch."

Accordingly, we suggest the following amendment to the Constitution of the Medical Society of the State of New York:

"Article XI, Section 1, shall be amended so that there be deleted from the fourth paragraph the name 'St. Lawrence;' and so that there be added to the fifth paragraph the name 'St. Lawrence.'

These paragraphs would then read:

"The Fourth District Branch shall comprise the members of the Medical Societies of the Counties of Franklin, Clinton, Essex, Hamilton, Fulton, Montgomery, Schenectady, Saratoga, Warren, and Washington.

'The Fifth District Branch shall comprise the members of the Medical Societies of the Counties of Onondaga, Oncida, Herkimer, Oswego, Lewis, Madison, Jefferson, and St. Lawrence."

Speaker Bauer: This being an amendment to the Constitution, no action is required on it at this time, but it will remain in the hands of the Secretary and be acted on next year after publication.

Section 17

(Resolution presented by Dr. Heyd, which was in Executive Session, withdrawn.—Secretary.)

SPEAKER BAUER: Are there any other resolutions?

Section 18. (Sec 44)

### Women Medical Students and Interns

DR. EMILY D. BARRINGER, New York: I should like to present the following resolution:

"Whereas, the Medical Society of the State of New York has had the vision and courage to endorse and expedite the securing of commissions in the Medical Corps of the Army and Navy for women physicians; and

"Whereas, the satisfactory commissioning of women physicians in the Medical Corps depends on a supply of well-trained applicants; and

"Whereas, the premedical and medical education of women physicians has been seriously affected by the accelerated medical educational program of the Army and Navy, in which the best interests of the women physicians have been ignored, and there is no national standardization in regard to the status of the woman medical student, she being in the position of the proverbial stepchild, while the man medical student is receiving every educational and monetary consideration from the government; and

"Whereas, the woman physician is held equally responsible in the eyes of law, because the same license to practice medicine is issued to her as to

her brother colleague; therefore be it "Resolved, that the Medical Society of the State of New York appoint a special committee to study the problem of the status of the woman medical student and intern; that this committee be instructed to evaluate the many difficulties of the problem, and have power to act to correct them; further, that on this committee there should be at least two women physicians who are known to be vitally interested in the matter, and that one of these women should be the incoming President of the American Medical Women's Association, who is a member of our Society."

SPEAKER BAUER: That is referred to the Reference Committee on New Business B, of which Dr. Eggston is Chairman.

Section 19. (Sec 46)

Noninclusion of X-Ray and Anesthesia in Any Hospital Service Plan

Dr. Thurber LeWin: I am instructed by the Medical Society of the County of Erie to present the following resolution:

"Whereas, a motion was made, seconded, and carried that the Medical Society of the County of Erie solicit the aid of the State Society against the inclusion of x-ray and anesthesia in any Hospital Service Plan; therefore be it "Resolved, that the State Society establish a definite stand on this matter."

SPEAKER BAUER: That is referred to the Reference Committee on New Business C, of which Dr. Kenney is Chairman.

Section 20. (See 54)

Special Membership Fee for Interns and Residents

Dr. Thurber LeWin: This is also being introduced upon the instruction of the Medical Society of the County of Erie:

"Whereas, it would be in the best interests of the younger men to join the State Society; therefore be it

"Resolved, that interns and residents in hospitals be permitted to join the organization at a reduced fee"

SPEAKER BAUER: That is referred to the Reference Committee on New Business A, of which Dr. Carroll is Chairman.

Section 21. (Sec 49)

#### 1945 Meeting Invitation to Buffalo

DR. THURBER LEWIN: This is the third resolution being introduced upon instruction of the Medical Society of the County of Erie:

"Whereas, the 1943 Annual Meeting of the Medical Society of the State of New York was a

great success in Buffalo; and

"Whereas, Dr. Herbert H. Bauckus, your

President-Elect, is a Buffalonian; and

"Whereas, the Medical Society of the County of Eric would deem it an honor and privilege to have its colleagues convene there again; therefore

be it "Resolved, that the Medical Society of the County of Eric extend an invitation to the Medical

Society of the State of New York to hold its 1945 Annual Meeting in Buffalo." SPEAKER BAUER: That is referred to Reference Committee on New Business C, of which Dr. Kenney

is Chairman.

Section 22. (See 39)

### United Medical Service

DR. BENJAMIN M. BERNSTEIN, Kings: This is a resolution concerning the United Medical Service:

in the interests of public health and welfare, without endangering medical standards, threatening the professional interests of the practitioner or the financial capacity of our people."

SPEAKER BAUER: That is referred to the Reference Committee on New Business C, of which Dr. Kenney is the Chairman.

Section 30. (See 43, 82)

### Enforcement of Medical Practice Act

Dr. E. Leslie Burwell, Westchester: This concerns the enforcement of the Medical Practice Act:

"Whereas, the Medical Practice Act of the State of New York defines the practice of medicine as follows: 'A person practices medicine . . . . who holds himself out as being able to diagnose, treat, operate or prescribe for any human disease, pain, injury, deformity, or physical condition, and who shall either offer or undertake, by any means or method, to diagnose, treat, operate or prescribe for any human disease, pain, injury, deformity, or

physical condition'; and
"Whereas, chiropractors are practicing medicine throughout the State of New York within the definition of the practice of medicine above

quoted; and
"Whereas, New York State likewise has a clear and satisfactory definition of the standards of education and training to be required of anyone who seeks to practice medicine and these stand-ards are not met by chiropractic practitioners; therefore, be it

"Resolved, by the House of Delegates of the Medical Society of the State of New York, that it be recommended to the Governor and the Legislature of the State of New York that the Medical Practice Act be enforced in the interests of the health and welfare of the citizens of this State."

SPEAKER BAUER: That is referred to the Reference Committee on New Business B, of which Dr. Eggston is the Chairman.

Section 31

Constitution and Bylaws—Proposed Amendment to Section 2 of Chapter XV of Bylaws-Action Delayed One Year

Dr. Ezra A. Wolff: This is presented on behalf of the Medical Society of the County of Queens:

"It is proposed to amend the first paragraph of Section 2, Chapter XV, of the Bylaws to read as follows: 'Chapter XV, Section 2. When an active member in good standing in any component county medical society removes to another county in this State, transfer of his name to the roster of the county society to which he removes shall be contingent upon the acceptance of the board of censors or comitia minora of the latter society. Such transfer shall be made at the member's request and be effected without cost to him and provided that he files a certificate with the secretary signed by the president and secretary of the component society from which he removes as to his good standing in such society. No member, however, shall be an active member of more than one component county society, nor shall any component county society accept a physician residing in another county in any other way than in accordance with the law governing transfers."

SPEAKER BAUER: This need not be acted upon at the present time because it contemplates a change in the Bylaws of the State Society. It will, therefore,

lay over in the hands of the Secretary for one year, and after publication will be presented again for action next year by the House.

Section 32. (See 56)

Approving Action of American Medical Association on Noninclusion of Medical Services in Hospital Insurance Plans

DR. STEPHEN H. CURTIS, Rensselaer: This is from the Section on Pathology:

"WHEREAS, the Council of the Medical Society of the State of New York has affirmed the position of the American Medical Association in opposing the inclusion of pathology, radiology, anesthesia, physical therapy, or any other form of the practice of medicine in a voluntary hospital or Blue Cross Plan: and

"Whereas, it is opposed to hospitals accepting contracts of this kind and proposes that these insurance contracts for medical services be cared for by the voluntary nonprofit medical care plan;

"Resolved, that this House of Delegates go on record as approving this action by the American Medical Association."

SPEAKER BAUER: That is referred to the Reference Committee on New Business A, of which Dr. Carroll is the Chairman.

Section 83. (See 42)

Opposition to Medical Section of the Wagner-Murray-Dingell Health Control Bill

DR. STEPHEN H. CURTIS, Rensselaer: This is from the Third District Branch:

"Whereas, it is the sentiment of the representatives of the component county societies of the Third District Branch, developed at a meeting held in Albany, January 19, 1944, that they are unanimously opposed to the Medical Section of the Wagner-Murray-Dingell Health Control Bill;

be it
"Resolved, that the House of Delegates of the
Resolved, that the House of New York take Medical Society of the State of New York take action in expressing its opposition to the Medical Section of this Bill."

SPEAKER BAUER: That is referred to the Reference Committee on New Business B, of which Dr. Eggston is the Chairman.

Section 34. (See 77)

Malpractice Insurance

Dr. Thomas M. D'Angelo, Queens: This is presented on behalf of the Medical Society of the County of Queens:

"WHEREAS, it has come to the attention of the Comitia Minora of the Medical Society of the County of Queens, Inc., that there are other insurance carriers writing malpractice insurance in the metropolitan area at a premium rate considerably less than the rate under our present group

plan; and
"Whereas, the contract offered by these companies is broader in many respects and affords a

more complete coverage; and "Whereas, many men formerly insured under the group plan have dropped that insurance and are taking out individual contracts; and

"WHEREAS, such practices will eventually disrupt the State Group Plan; therefore be it "Resolved, that the entire matter of the selecthe Bylaws, no action is necessary upon it at this time, but it will remain in the hands of the Secretary for one year, when, after due publication, it will come up for consideration next year by this House.

Section 27. (Sec 48)

# Appointment of Reference Committees of American Medical Association

Dr. C. James F. Parsons, Weslchesler: This resolution is being proposed at the direction of the Weslchester County medical Society:

"Whereas, Section 1 of Chapter X of the Bylaws of the American Medical Association provides that 'immediately after the organization of the House of Delegates at each annual session, the Speaker of the House of Delegates shall appoint from the members of the House such committees as may be deemed expedient by the House of Delegates. Each Committee shall consist of five members, unless otherwise provided, the chairman to be specified by the Speaker. These Committees shall serve during the session at which they are appointed.' and

"Whereas, in the interest of assuring proper representation to various opinions and viewpoints in the personnel of reference committees dealing with major policies or controversial questions, it would seem desirable that the House of Delegates have an opportunity to pass upon the appointments to these committees as proposed by the

Speaker of the House; therefore, be it

"Resolved, that the Delegates from the Medical
Society of the State of New York to the House of
Delegates of the American Medical Association be
instructed to present a proposed amendment to
the Bylaws of the American Medical Association
whereby the following sentences would be added
to Section 1, Chapter X, of the Bylaws as above
quoted: "The proposed appointments to all reference committees shall be submitted to the House
of Delegates for approval and confirmation by a
majority of the Delegates present. Members of
the House of Delegates shall then have an opportunity to offer motions for removal or addition of
names of individual delegates for any of these
committees, before it shall be confirmed by the
House of Delegates."

SPEAKER BAUDR: That is referred to the Reference Committee on New Business C, of which Dr. Kenney is Chairman.

Section 28. (See 57)

#### Proposed Amendment of Bylaws of the American Medical Association Relative to the Powers of the Board of Trustees

Dr. C. James F. Parsons, Westchester: This is another resolution introduced at the instruction of the Westchester County Medical Society:

"Whereas, it was clearly the intent of the framers of the Constitution and Bylaws of the American Medical Association that the House of Delegates shall be the supreme authority for the determination of the Association's policies; and

"Whereas, Section 1 of Chapter VI of the Bylaws of the American Medical Association provides in part as follows: 'All resolutions or recommendations of the House of Delegates pertaining to the expenditure of money must be approved by the Board of Trustees before the same shall become effective'; and

"WHEREAS, this blanket authority conferred

upon the Board of Trustees of the American Medical Association may be, and has been, used as a veto power on the part of the Board of Trustees upon resolutions adopted by the House of Delegates expressing the clear will and mandate of the House; and

"Whereas, it is clearly not in the best interests of the profession nor in harmony with democratic procedure for the Board of Trustees, existing only as agent of the House of Delegates, to have the power and authority to countermand the declared purposes of the House of Delegates through the withholding of necessary funds for the accomplish-

ment of such purposes; therefore, be it
"Resolved, that the Delegates of the Medical Society of the State of New York to the House of Delegates of the American Medical Association be instructed to propose an amendment to the Bylaws of the American Medical Association at the 1944 next meeting of the House of Delegates of the American Medical Association, providing that the sentence in Section 1 of Chapter VI, of the Bylaws of the American Medical Association reading 'All resolutions or recommendations of the House of Delegates pertaining to the expenditure of money must be approved by the Board of Trustees before the same shall become effective' shall be deleted and that the following sentences shall be substituted for the deleted sentence: 'It shall be the duty of the Board of Trustees to make effective in the shortest possible time the expressed purposes and mandates of the House of Delegates as embodied in its resolutions and formal recommendations. In case the Board of Trustees shall object to such a mandate, it shall report its reasons to the House of Delegates at the earliest opportunity. The action of the Board of Trustees may then be overridden by a vote of two-thirds of the Delegates present and voting "

SPEAKER BAUER: That is referred to the Reference Committee on New Business A, of which Dr. Carroll is the Chairman.

Section 29. (See 45)

# Promotion of Working Relationship with State Agencies

DR. RALPH T. B. Todd, Westchester: I wish to present the following resolution:

"Whereas, His Excellency, the Governor, in his annual message, recognized that the State 'has an essential function' in meeting the needs of its citizens for good medical care; and

"Whereas, the Medical Society of the State of New York has notified the Governor, by means of a letter from the Council of the Society, that its membership is ready and willing to cooperate in every possible way with the State government, in order to assure to all citizens of the State adequate and effective medical care; and

"WHEREAS, various committees of the Medical Society of the State of New York have established close working relationships in recent years with various departments of the State government;

therefore be it "Resolved, that the House of Delegates approves the efforts of the Council, through its various appropriate committees, in furthering these relations and in assisting the State gavernment in every feasible way, to accomplish the objectives set forth by Governor Dewey in his annual message—namely, 'a partnership of government and the medical profession functioning cooperatively

has carefully reviewed the Report of the Council, Part III, "School Health Program." We note that the Council has appointed three physicians to act in an advisory capacity to the State Education Department, and that these physicians, acting with the Subcommittee on Child Welfare, have assisted in the preparation of a syllabus for health-teaching in the schools. We note interest in this subject also by the State Department of Health and the New York State Association of School Physicians.

Another paragraph of the report states that examination of teachers and other school personnel, as art of the Tuberculosis Control Program, is receiving the attention of the State Education De-

There is also a statement of the principal activities of the Medical Society of the State of New York in school health, with the added note that there has been satisfactory cooperation between the State Departments of Education and of Health, the New Jork State Association of School Physicians, the Dental Society of the State of New York, several other organizations (unnamed) concerned with the School Health Program, and the Medical Society of the State of New York. We note with approval that to date forty-five of the sixty-one county medical societies of the State have appointed committees or designated representatives in school health.

We recommend the adoption of this part of the Report of the Council, and I so move.

. The motion was seconded, and as there was no discussion, it was put to a vote, and was unanimously carried.

Dr. SCHIFF: Your Committee notes that one important phase of the school health program apparently has not been given the attention it merits either in this or previous reports of this Council Subcommittee.

We refer to the matter of instruction of health teachers. At the present time the percentage of eachers qualified to give health instruction is very The courses in public health instruction, available in the normal school in state teachers' colleges, are not utilized to their full advantage. If we are to have good health instruction in the schools, we must have a sufficient number of well-qualified teachers.

We therefore recommend to the Subcommittee that they place special emphasis on this phase of the subject during the coming year.

I move the adoption of this portion of the report. .The motion was seconded, and as there was no discussion, it was put to a vote, and was unanimously carried.

DR. SCHIFF: I now move the adoption of the report of the Reference Committee, consisting of Leo F. Schiff, Chairman, Louis A. Friedman, Alfred M. Hellman, Ralph I. Lloyd, and Ralph Sheldon, as a

The motion was seconded, and as there was no discussion, it was put to a vote, and was unanimously carried..... Section 38. (See 6)

Report of Reference Committee on Report and Supplementary Report of Council—Part I: Post-

DR. ALBERT F. R. ANDRESEN, Kings: In spite of war conditions which obviously must have hampered its efforts, the Council Committee on Public Health and Education, under the brilliant leadership of Dr. Oliver W. H. Mitchell, its chairman, has not only continued but broadened its work in postgraduate education. By obtaining the further cooperation

and assistance of the New York State Department of Health, Dr. Mitchell has succeeded in lightening the financial burden which the expanding work of his committee would entail. Cooperation and advice from the New York State Department of Labor, the Dental Society of the State of New York, the medical schools of the State, and various health, civic, farm, and welfare organizations have resulted in a program of postgraduate education of which our Society should be very proud, and which may well serve as a pattern for like efforts in other parts of the world. A list of the courses and lectures available through the efforts of the Committee, which was previously mimeographed, was this year printed and now makes a volume, the Course Oulline Book, which has been which places the Madical widely distributed, and which places the Medical Society of the State of New York in the front rank of postgraduate teaching institutions.

The instruction has been given under two categories, the Committee furnishing speakers and paying their expenses plus an honorarium:

1. Lectures or series of lectures have been given to county medical societies which have selected them from the Course Outline Book. Sixty-two such lectures were given in eighteen counties.

2. Regional Meetings and Teaching Days have been arranged for in seven regions of the State, five on cancer, and one each on nutrition and tuberculosis and chest diseases, with a total of twenty-four lec-

The Committee and the Department of Health are now planning an intensive campaign of instruction in penicillin therapy for the county medical societies and lectures on medical and surgical care of home and farm accidents at meetings of county medical societies and other medical groups.

In all, ninety-six lectures were given in twentyseven counties, sixty-eight lectures having been given jointly with the New York State Department of Health. One more is being arranged for.

Your Reference Committee recommends that the report of the Council, Part I, be accepted with the thanks and appreciation of the Medical Society of the State of New York, and I so move.

... The motion was seconded, and as there was no discussion, was put to a vote, and was unanimously

DR. ANDRESEN: That completes the report of the Reference Committee on Report of the Council and Supplementary Report, Part I, consisting of Albert F. R. Andresen, Chairman, Emil Koffler, Leon M. Kysor, Beverly C. Smith, and Charles C. Trembley. Speaker Bauer: Thank you, Dr. Andresen!

Section 39. (Scc 22, 50-51)

Report of Reference Committee on Report of eport or kererence commutee on keport or Council—Part VII: Nonprofit Medical Expense Insurance; Resolution on United Medical Service

DR. ALBERT A. GARTNER, Eric: Your Reference Committee on Nonprofit Medical Expense Insurance has reviewed with a great deal of interest a report of the Council Committee on this subject. We agreed that nonprofit medical expense insurance is an important answer to the Wagner-Murray-

We agreed that there is a great desire on the part of the public to budget and insure against the cost of medical care. The public most certainly fears and despises the admixture of politics into medicine The public wants to be unhampered in the choice of its physicians.

The Reference Committee recommends that the

tion of the carrier of the malpractice insurance be restudied by a special committee appointed by the Council to survey the entire field in order that we may get the most complete and adequate coverage with the maximum saving on premiums for the membership of the State Society; and further be it

"Resolved, that this Committee's report be referred to the Insurance Committee for final study and that each county society be informed, after the selection of the carrier, the reasons for that selection and also the reasons for the rejection of the other competitors so that each county society may be in a position to properly inform their membership in order that we may encourage 100 per cent unity in our State Malpractice Group coverage."

SPEAKER BAUER: That is referred to the Reference Committee on Report of the Council, Part XI, Malpractice Defense and Insurance, Dr. Krakow, Chairman.

Are there any further resolutions to be presented that this time?

.... There was no response. . . .

SPEAKER BAUER: When we recess, which we will in a moment, I will ask you to bear in mind that the financial success of any of our meetings depends very largely on the cooperation of our technical exhibitors. I hope every member of the House will feel that it is his duty to visit all these technical exhibits, so that they may know you are interested in what they are doing to help make our meeting successful. You have to go through this exhibit area both on your way to the House and out of it, so that is an excellent time to visit them. I hope everyone will visit each exhibit at least once while the meeting is on.

This is the last call for this morning: Are there

any other resolutions?

...There was no response....

Speaker Bauer: If there are none, the House will be in recess until 3:30 this afternoon. Please be prompt.

(At 11:35 A.M., a recess was taken.)

### Afternoon Session

May 8, 1944

The session convened at 3:30 P.M., pursuant to recess.

SPEAKER BAUER: The House will be in order.

Section 35. (See 1)

### Report of Reference Committee on Credentials

SPEAKER BAUER: The Report of the Credentials Committee on the morning attendance was: county delegates, 129; officers, 19; past-presidents, 5; section delegates, 7; district delegates, 2; or a total of 162.

The Manhattan Room, where the majority of the Reference Committees have been meeting, will not be available after 4:00 r.m. this afternoon. Any Reference Committees that still need a place to meet will have to find some committee member's room.

The tables for the New Business Reference Committees will be available in the anteroom during today, but will not be available there tomorrow.

All Reference Committees will find stenographers in Conference Room 8 from 8:30 on tomorrow morning. They were also there today.

Are there any Reference Committee Chairmen ready to report?

Section 36. (See 12)

### Report of Reference Committee on Report of the Council—Part V: Publications and Medical Publicity

DR. WILLIAM B. RAWLS, New York: The Committee approves of the publicity on medical expense insurance but believes that greater attention should be given to this subject. The Committee recommends to the Council that an additional editorial department on medical expense insurance be established to publish regularly such information as is available, and further recommends that for a period of one year free advertising space, as well as reading matter in the text, be given to those organizations approved by the Medical Society of the State of New York. The amount of space allotted shall be left to the discretion of the Council.

I move the adoption of this portion of the report.
...The motion was seconded, and as there was no discussion, it was put to a vote, and was unanimously corried.

mously carried.....
Dr. Rawls: The Committee recommends to the House of Delegates that the recommendation of the Special Committee on Publications be approved.

....The motion was seconded, and as there was no discussion, it was put to a vote, and was unanimously carried.....

DR. RAWIS: In reference to printing a new Directory at present, it is almost impossible to secure paper and personnel. The shortage of paper is acute, and it is difficult to obtain enough paper for publication of the JOURNAL. It might be possible to secure paper later, and your Committee recommends that no effort be made to publish a Directory at present, but that the Council be instructed to publish a Directory when, as, and if they believe it is feasible.

I move the adoption of this portion of the report.

... The motion was seconded, and as there was no discussion, it was put to a vote, and was

unanimously carried.....

Dr. Rawls: The committee noted with interest the change of business arrangements with regard to advertising in the JOURNAL. This was made possible by the experience and diligence of your Publication Committee, and they note with pleasure that there is now an operating surplus.

I move the adoption of the report of the Reference Committee, consisting of William B. Rawls, Chairman, J. Lewis Amster, Joseph P. Henry, Thurber LeWin, and Lyman C. Lewis, as a whole. The last part is purely informative, and requires proceeding exting

no specific action.
... The motion was seconded, and as there was no discussion, it was put to a vote, and was unani-

mously carried.....

Section 37

Report of Reference Committee on the Report of the Council—Part III: School Health

Dr. Leo F. Schiff: Your Reference Committee

Care are subject to the existing law, but the Reference Committee feels that the various portions of the report should receive careful consideration and discussion by the House of Delegates:

 The Resultement That Payment Be Made Directly to the Physician or the Hospital Rendering Serrice.

We scree with the view of the Council that this money should be paid directly to the servicemen's wives, thereby eliminating a third party in the relationship of physician to patient, and also discrediting any factor which might tend towards socializing medicine.

2. The Provision of Hospital Care at the "Ward Cost per Patient Day" to be Determined by a Prearranged Formula.

We agree with the opinion of the Council Committee, but feel it should be the privilege of the patient to be allowed to pay more for better accommodations if she so desires.

Dr. George W. Kosmar: Should not each of

these be acted on separately?

SPEAKER BAUER: Yes.

Dr. Donovan: In that case I move the adoption of Paragraph I.

....The motion was seconded..... SPEAKER BAUER: You have before you the motion of the Chairman of the Reference Committee on the adoption of that portion of the report which approves the action of the Committee, and seconds the statement that the emoluments should be paid direct to the patient and not to the physician, a stand which was previously taken by the House of Delegates of the American Medical Association. Is there any discussion on it?

DR. GEORGE W. KOSMAR, New York: It seems to me that this is out of order. The method of payment was established by Act of Congress. If we want to attack that we will have to do it in a different way from the one which is proposed here.

think this recommendation is meaningless. SPEAKER BAUER: I understand that the motion of the Chairman of the Reference Committee is merely stating a principle, and that he has not made a motion as to any remedy for the situation. Is

that correct?

DR. DONOVAN: Yes. The Reference Committee, before we got very deeply into this, agreed that all of this was left up to the Senate and House of Representatives, and that we had nothing to say about it; but we did believe we should make some recommendations here. Anything we do here is not binding in any respect-we realize that-but we just recommend that the House of Delegates back us up in our enunciation of certain principles, even though the restatement of those principles would not accomplish very much, for the matter would have to go through Washington, as Dr. Kosmak has just stated.

Speaker Bauer: I take it that this is merely an expression of opinion on the part of the Reference Committee, and if it is adopted on the part of the House of Delegates it will merely be as a statement

of principle.

Is there any further discussion?

DR. ABRAHAM KOPLOWITZ, Kings: Dr. Kosmak's point, I believe, is a good one. There should be a mention here about memorializing Congress to make the change. That can be added.

the change. That can be added.

SPEAKER BAUER: Do you wish to make an amend-

ment to that effect?

Dr. Koplowitz: Dr. Kosmak has made it, so I will second it

SPEAKER BAYER: He did not make a motion. Dr. Koplowitz: Then I will make it.

DR. JOSEPH A. GEIS, Essex: Before we put the motion, was this an Act of Congress or an interpretation of an Act of Congress as developed by the Children's Bureau? I question whether Congress stated that the money had to be paid directly to the physician. I believe that is an interpretation of the Children's Bureau on that Act.

Dr. Kosman: May I correct that? It is an Act of

Speaker Bauer: It is in the Appropriations Act. I believe, Dr. Geis.

Dr. Kosmak: Yes. Speaker Bauer: Dr. Koplowitz has made b motion to amend the Reference Committee's report by inserting in it a recommendation that the Medical Society of the State of New York memorialize Congress relative to our opinion in this matter. Is the amendment seconded:

DR. THOMAS M. D'ANGELO, Queens: Yes, I will second it.

Speaker Bauer: It has been moved and seconded that the motion be amended as just stated. Is there

any discussion on the amendment? DR. JAMES F. ROONEY, Albany: I differ from the opinion stated that this method of payment is specified in the Act. During the last five months there has been a great deal of discussion on this matter in Albany County and many of the upstate counties, and a very careful study has been made of both the original act and the amended act which appropriates this money to the Children's Bureau to be dispensed in such manner as they shall deter-mine by regulation. The responsibility as to the manner in which this money is to be distributed through the individual state departments is not embodied in the Act of Congress. It is purely and simply a matter of regulation by the Children's Bureau under the Department of Labor.

Memorializing Congress, in my opinion, may help, perhaps, to have Congress amend the Act so that it will provide or at least one may hope that Congress will so direct—that the fund shall be expended in the manner which the Society seems to wish. own feeling as to how much will be gained by asking Congress to amend this Act in the present state of the country and the administration is not very hope-

SPEAKER BAUER: Is there any further discussion? DR. THOMAS M. D'ANGELO, Queens: I move the matter be tabled pending a complete interpretation of the Act before this body.

SPEAKER BAUER: You cannot table the amend-

ment without tabling the whole matter.

Dr. D'ANGELO: Right. That is why I am moving to table the entire matter--for that very reason. DR. ROONEY: I should like to

Speaker Bauer: You cannot discuss a motion

to table.

Dr. Rooner: What is the motion—to table definitely or indefinitely?

SPEAKER BAUER: No time limit, as I understand

Dr. D'ANGELO: To table until we get an interpretation of the Act.

SPEAKER BAUER: That is postponing action, then, and not tabling.

DR. ROONEY: Right; that is what I thought. SPEAKER BAUER: You may discuss it, then. Dr. Rooney: I hope that the House will not italicized statement of the cost for various coverages

as mentioned on page 754 be deleted.

The Reference Committee recommends that the Council appoint a full-time Director of Medical Expense Insurance or establish a bureau. Such Director should be thoroughly conversant with insurance matters. It is hoped by our Committee that a state-wide plan may soon be evolved.

I move the adoption of this portion of the report. SPEAKER BAUER: This portion of the report contains two items, one of which is also in the hands of another reference committee-namely, the Reference Committee which is considering the report of the Planning Committee for Medical Policies, having to do with the appointment of a full-time Director of Medical Expense Insurance. Therefore, the Chair-man would suggest that that portion of the report be tabled until after the Reference Committee on the Report of the Planning Committee for Medical Policies has been given so that they may be considered together.

Dr. HARRY ARANOW, Bronx: I so move.

SPEAKER BAUER: I take it your motion is that the report of the Reference Committee on Report of the Council, Part VII, be adopted, as it pertains to the deletion of the italicized statement of the cost for various coverages on page 754 and that the portion pertaining to the establishment of a full-time Director of Medical Expense Insurance be tabled until the Planning Committee's report is considered, when it will be considered in connection with the report of the Reference Committee that has that under consideration.

Dr. Aranow: Yes.

....The motion was seconded, and was put to a

vote, and was unanimously carried....

SPEAKER BAUER: The motion is carried, and that portion of the report of the Reference Committee is adopted, with the exception of the part which per-tains to the establishment of a full-time Director of Medical Expense Insurance, which is tabled until the Reference Committee on the Report of the Planning Committee for Medical Policies reports, when the two will be considered together.

DR. GARTNER: The Reference Committee is strongly in favor of the hospitals not practicing medicine, and approves the report of the House of Delegates of the American Medical Association on this matter as published on pages 755 and 756 of

the Annual Report of the Council.

Your Reference Committee on Nonprofit Medical Expense Insurance unanimously endorses a resolution that was introduced by Dr. Benjamin M. Bernstein in regard to the merged United Medical Service, and moves the adoption of this resolution as a House of Delegates.

I move the adoption of this portion of the report.

... The motion was seconded....
SPEAKER BAUER: Would you outline the purpose of the resolution referred to as having been introduced by Dr. Bernstein this morning, so that the House may be familiar with it? There were a good many resolutions introduced this morning, and I am sure that the Delegates don't know which one it is that is specifically referred to in the report of your Reference Committee.

DR. GARTNER: That resolution, introduced this morning by Dr. Bernstein, of Kings, reads:

"WHEREAS, the United Medical Service has been organized by a merger of the Community Care Plan and the Medical Expense Fund of New York; and

"WHEREAS, it is urgent that a plan for health

insurance which would be workable and salable as well as equitable to both the doctor and the public be put into operation without further delay;

"WHEREAS, the rapid sale of this plan to a large number of subscribers will be of enormous value in counteracting the attempts being made by government to control the practice of medicine;

"WHEREAS, the United Medical Service is a plan for health insurance entirely under control of the medical profession; and

"Whereas, this plan has an adequate amount of cash on hand to pay the bills for medical care; and "WHEREAS, this plan does not ask the doctor to

contribute to the financial setup or for the carrying on of its activities; and

"WHEREAS, it is for the benefit of the physician as well as the patient that the provisions of this plan provide for free choice of physician without the restrictions imposed by a panel system; therefore be it

"Resolved, by the House of Delegates of the Medical Society of the State of New York in convention assembled on May 8, that it does hereby approve the plan of United Medical Serv-

ice; and be it further "Resolved, that it urges every practicing physician in the seventeen counties governed by the scope of the plan to give it his whole-hearted support and signify his or her willingness to serve in accordance with the provisions of the plan as soon as support is formally requested.

SPEAKER BAUER: You have before you the motion of the Chairman of the Reference Committee for the adoption of this portion of the report, which carries with it the approval of the resolution which has just been read. Is there any discussion?

DR. THOMAS M. D'ANGELO, Queens: The resolu-

tion specifies the Community Care Plan and the United Medical Service. That is an error. It is the United Medical Service all right, but the other is the Community Medical Care or Community Medical Service.

SPEAKER BAUER: A correction of title.

DR. D'ANGELO: Right.

SPEAKER BAUER: I am sure the Chairman of the Reference Committee will make that change without any specific motion.

DR. GARTNER: Yes.

SPEAKER BAUER: Is there any other discussion? ... The question was called for, and the motion was put to a vote, and was unanimously adopted...

SPEAKER BAUER: The resolution, as amended, is

adopted. DR. GARTNER: Mr. Speaker, I move the adoption of the report of the Reference Committee as a whole,

with the exception of that part that has been tabled.

SPEAKER BAUER: Your motion is out of order We will wait until we again consider that portion of the report, and then you may move for the adoption of the report as a whole. We shall have to call you back for that.

Section 40. (See 64, 87)

Report of Reference Committee on Report of Council-Part II: Maternal and Child Welfare

The Reference DR. JOHN T. DONOVAN, Erie: Committee realizes and appreciates the enormity of the work done by the Special Committee of the Council, and realizes fully that the provisions of the report concerning Emergency Maternity and Infant

Your Reference Committee on New Business B approves and moves the adoption of the above resolution.

.. The motion was seconded, and as there was no discussion, it was put to a vote, and was unanimously carried .....

Section 42. (See 33)

Report of Reference Committee on New Business B-Opposition to Medical Section of the Wagner-Murray-Dingell Health Control Bill

Dr. A. A. Eggston, Westchester: Resolution introduced by Dr. Stephen H. Curtis, of the Third District Branch, reading:

"Whereas, it is the sentiment of the representatives of the component county societies of the Third District Branch developed at a meeting held in Albany, January 19, 1944, that they are unanimously opposed to the Medical Section of the Wagner-Murray-Dingell Health Control Bill; be

"Resolved, that the House of Delegates of the Medical Society of the State of New York take similar action in expressing its opposition to the Medical Section of this bill.

Your Reference Committee on New Business B approves, and moves the adoption of the above resolution.

... The motion was seconded, and as there was no discussion, it was put to a vote, and was unanimously carried. . . .

Section 43. (See 30, 82)

Report of Reference Committee on New Business B-Enforcement of Medical Practice Act

Dr. A. A. Eggston, Westchester: Resolution introduced by Dr. E. Leslie Burwell, of the Westchester County Medical Society, pertaining to the enforcement of Medical Practice Act, reading:

"Whereas, the Medical Practice Act of the State of New York defines the practice of medicine as follows: 'A person practices medicine. . . . who holds himself out as being able to diagnose, treat, operate or prescribe for any human disease, pain, injury, deformity, or physical condition, and who shall either offer or undertake, by any means or method, to diagnose, treat, operate or prescribe for any human disease, pain, injury, deformity, or physical condition'; and "Whereas, chiropractors are practicing medicine throughout the State of New York within

the definition of the practice of medicine above quoted; and

"WHEREAS, New York State likewise has a clear and satisfactory definition of the standards of education and training to be required of anyone who seeks to practice medicine, and these standards are not met by chiropractic practitioners; therefore be it

"Resolved, by the House of Delegates of the Medical Society of the State of New York, that it be recommended to the Governor and the Legislature of the State of New York that the Medical Practice Act be enforced, in the interests of the health and welfare of the citizens of this State.

Your Reference Committee decided that there should be a slight change in the "Resolved" part.

Your Reference Committee on New Business B approves of this resolution, but wishes to substitute the following paragraph for the last paragraph of the original resolution, namely:

"Resolved, by the House of Delegates of the Medical Society of the State of New York, that it be recommended to the Governor and the Legislature of the State of New York that the Medical Practice Act be more rigidly'

and those are the two words we inserted-"more rigidly"-

"enforced in the interests of the health and welfare of the citizens of this State."

Your Reference Committee on New Business B moves the adoption of this modified resolution.

... The motion was seconded.....

SPEAKER BAUER: You have before you the report of the Reference Committee which approves the resolution as read with the insertion of the two words "more rigidly" before the word "enforced." It pertains to the enforcement of the Medical Practice Act, particularly with respect to chiropractors. Is there any discussion?

Dr. John J. Masterson, Kings: How are the Legislature and the Governor to know what we mean if we just say that the law is to be more rigidly enforced? I don't see any reason why we should call their attention to the fact that the chiropractors are violating the law every day that they practice.

SPEAKER BAUER: Is there any further discussion? Dr. Jacob Werne, Queens: The technic is very simple. If every county medical society had an active committee for the investigation of illegal practice, and referred these cases to the Attorney General's office, we might get some action. If this resolution were so amended as to petition the Governor to instruct his Attorney General to honor recommendations from the county societies, and investigate them on their initiative (these charges against

chiropractors) we might put some teeth into this law.

Dr. Harry Aranow, Bronz: Far be it from me to try to protect the chiropractors, but I think we are wasting a lot of words. Those of you who have read the special report of the committee of the Legislature on this subject know that the legislators are aware of the fact that there are people practicing chiropractic in this State, and that the law is not being enforced. All they say is that it cannot be enforced, so it should be legalized. The testimony of our different Attorneys General will tell you the same thing: that it is almost impossible to convict a chiropractor of practicing medicine illegally. The law-enforcing agencies in this State have tried it over and over again, with no success, so I think that this resolution is simply a waste of words, because the legislators know about it, and if you force it too strongly they will legalize the practice of chiropractic. They tried to do that this year, and almost succeeded. I should like to get Dr. Lawrence's opinion on this matter too.

SPEAKER BAUER: The Chairman will be glad to grant the floor to Dr. Lawrence.

Dr. Joseph S. Lawrence: The matter of enforcing the Medical Practice Act is not simple. As Dr. Aranow has indicated, the legislators are aware of the fact that it is not being enforced. Attorney General has done his utmost to enforce it under the present law. There is a possibility, however, that the law could be changed so as to make it enforcible.

An effort was made a few years ago to enjoin the chiropractors from practicing, but that remedy was not available under the present law. I mean the effort that was being made was stopped because of legal difficulties. However, the law could be changed so that the cases would not be brought be-

adopt the amendment, but that it will take such action as will refer this matter to the Council for consideration and such disposition as in their opin-

ion may be feasible under the circumstances.

SPEAKER BAUER: The question now is on postponing action on this until we get a legal interpreta-tion. That takes precedence over the amendment. Is there any further discussion on postponing action?

... The question was called for .....

SPEAKER BAUER: All those in favor of the motion, which is to postpone action until later, will please say "Aye"; those opposed, "No." The Chairman is in doubt. Those in favor of postponing action will please rise and remain standing until they are counted; now those opposed will please stand. The motion is carried, 64 to 44. The matter is then postponed.

Go ahead with your report.

Dr. Donovan: I will reread Paragraph 2:

2. The Provision of Hospital Care at the "Ward Cost per Patient Day" to be Determined by a Prearranged Formula.

We agree with the opinion of the Council Committee, but feel it should be the privilege of the patient to be allowed to pay more for better accommodations if she so desires.

I move adoption of this portion of the report.

DR. EDWARD P. FLOOD, Bronx: I move that action on this portion also be postponed until we have the legal interpretation of the statute.

... The motion was seconded...

SPEAKER BAUER: The motion has been made that this portion of the report also be postponed until a legal opinion is secured. Is there any discussion

on the amendment?

DR. JACOB L. LOCHNER, JR., Albany: We have studied this matter a lot up in Albany County. We have read the Congressional Record, and have talked with our representatives down there, and as a result have found that it was the intent of Congress to allow a women to choose her own doctor and her own hospital accommodations and to supplement them if she wanted to, but that the Children's Bureau ruled otherwise.

Congress needs to have a little pressure put on it to get this matter out of the Children's Burcau's hands in order to do what they formerly intended; but they cannot do that unless we send some representatives down there to make that presentation to them. I understand that at the last meeting of the Committee which considered this matter not a single doctor was present to represent the Medical Society of the State of New York or the American Medical

Association.

SPEAKER BAUER: At the last hearing there were doctors present from both organizations.

Dr. Lochner: I mean that when this bill was

passed there were none present.

.... The question was called for, and the motion was put to a vote, and was carried to postpone action until a legal interpretation of the law is secured.... Dr. Donovan: We come now to:

3. Provisions for Remuneration of Physicians.

We agree with the Council Committee that the remuneration is low.

There will be no disagreement about that.

(Laughter) I make a motion that this portion of the Reference Committee's report be adopted. Do you think it is necessary to vote specifically on that?

SPEAKER BAUER: No. DR DONOVAN: The fourth paragraph is:

4. The Plan Provides for Additional Fees Where the Services of a Qualified Consultant Arc Required; But Makes No Provision for Recognizing the Extra Services of a Qualified Obstetrician or Pediatrician Where Such Physician Has Undertaken the Basic Maternity or Sick Infant Care of a Patient Under the Plan.

We recommend the passage of the Council Committee's belief that some system should be devised for recognition of extra services of the qualified specialist and for compensating him in keeping with the extra services rendered.

I move the adoption of this portion of the report.

... The motion was seconded...

Speaker Bauer: This portion of the report has to do with the recognition of specialists and their compensation under this program. Is there any discussion?

Dr. Harry Aranow, Bronx: This thing has been discussed at great detail in the Council and by the various committees. I know that the Commissioner of Health of the State of New York tried to get this thing before Congress, and did not succeed. I would move that action on this also be postponed until we get the whole interpretation. It is all part of the one thing. Let us get an interpretation of the whole law, and find out what it is all about before we vote.

.. The motion was seconded, and as there was no discussion, the motion was put to a vote, and was carried....

SPEAKER BAUER: It is postponed.
DR. DONOVAN: Will this whole report be postponed? If so, why go on with it?
SPEAKER BAUER: The Chairman suggests to the Chairman of the Reference Committee that he discontinue the report as it pertains to the matter of Emergency Maternity and Infant Care, as there may be other factors in the report which would fall into the same category, and on which action also would have to be postponed pending an interpretation of the law. Such a course would save time, so if the House has no objection we will let the Chairman of the Reference Committee step down and as soon as we are able to get the legal interpretation he will bring in his report again.

CHORUS: That is right.

SPEAKER BAUER: That course will be followed then. Thank you, Dr. Donovan!

Section 41. (Sec 23)

Report of Reference Committee on New Business B-Establishment by American Medical Association of Section on Industrial Medicine

DR. A. A. EGGSTON, Westchester: Resolution introduced by Dr. B. M. Bernstein, of Kings, regarding the establishment by the A.M.A., of a Section in Industrial Medicine, and reading:

"WHEREAS, there is at present in operation a Council on Industrial Health of the A.M.A.; and

"WHEREAS, industrial medicine is becoming of increasing importance to the entire medical profession; and

"WHEREAS, the subject of industrial medicine as a specialized study ought to be encouraged and stimulated both in graduate and undergraduate medical training; and

"WHEREAS, a forum for the exchange of ideas and projects and methods and progress ought to

be provided on a national scale; therefore he it "Resolved, that the Medical Society of the State of New York request the American Medical Association to establish a Section in Industrial Medicine."

a hundred to seven or eight hundred letters, and sometimes two or three thousand, complaining bitterly about it. Every chiropractor in the State of New York contributes a minimum of \$100 a year to his Society. I hesitate to say how that money is

used. I know, but I shall not repeat it.

The second thing is: Politically, the Education Department of the State of New York and the Board of Regents are not in favor of a rigid enforcement of the Medical Practice Act in relation to chiropractic. We have even had in past years the Education Department, either directly or indirectly, bring their influence to bear upon the legislators to pass a chiropractic licensing act.

I don't see how you are going to do anything about this resolution by amending it as has been proposed. We have tried practically everything except the Basic Science Act, and I am not so sure that that is the remedy. I feel this: that the one thing that must be done if we are going to get enforcement of the law is to develop a popular attitude toward that enforcement, because we can put law after law on the statute books, and if it has not popular support it will never be enforced; and, frankly, the Medical Practice Act in relation to chiropractors has not as yet popular support. This one conviction that was just spoken of as having occurred in Kings County is to the best of my knowledge the only conviction of which I have any recollection in the last five years. It is estimated that there are practicing chiropractors in the State of New York somewhere in the neighborhood of 2,800 to 3,400, and one conviction will not alter the situation.

One swallow does not make a summer, gentlemen. Furthermore, I am not so sure that the statement that was made about the appeal to the higher court may not allow this man to escape from justice. I feel, and I have so felt for several years. that we must get over our fear of political visitation, and we must be willing to carry and take the onus of bringing pressure to bear upon the Legislature poli-Second, we must enlist in our own communities a popular support for the enforcement of the Medical Practice Act. (Applause)

DR. CHARLES F. McCarty, Kings: This is not going to make me popular. There has been an awful lot of pressure brought to bear upon the legislators to pass a chiropractic bill this year. Probably, if it had not been for a legislative trick, the chiropractic bill would have been passed last spring. When the chairmen of the legislative committees of the county societies met at Albany last winter, we spent a great deal of time in discussing chiropractic, and I think Dr. Lawrence will tell you that he has a feeling that eventually some type of a chiropractic bill will pass.

I should like to amend this to provide that the Council appoint a committee to study the type of bill which the New York State Medical Society would approve to allow a chiropractic bill to go through, one which would certainly see to it that no chiropractor who is not as well educated as a physician could practice.

DR. JACOB WERNE, Queens: Point of order; there is already one amendment to the original motion.

DR. McCARTY: I know it.

SPEAKER BAUER: An amendment can be amended; furthermore, this was in the nature of a substitute rather than an amendment.

....The substitute motion was seconded..... Speaker Bauer: The question is on the sub-

stitution first of Dr. McCarty's motion for the suggested amended original motion.

DR. WERNE: May I speak on it? Speaken Bauer: Yes, after I finish stating it. The substituted motion is that it be referred to a committee to work out a plan whereby a satisfactory chiropractic bill could be enacted with our support, which would maintain the present standards of medical practice. I believe that is the sum and substance of it?

DR. McCarty: Yes.

Speaker Bauer: Do you wish to speak on the substitute?

Dr. Werne: Yes. I think Dr. McCarty just passed over to us in another color the basic science law or something like it. In considering this we lose sight of one very important consideration. This is not a matter of competition with the practitioners of this is a matter involving the public medicine; health.

It is contrary to the best interests of public health for a chiropractor to exist. If any State medical organization recognizes the right to exist of a cult which is as phoney as chiropractic is, then I think we do not deserve to be considered representatives of Organized Medicine. We should stick to the stand enunciated by Dr. Bauckus this morning in his President-Elect's address: under no code should chiropractic be permitted recognition.

DR. EZRA A. WOLFF, Queens: The Reference Committee on the Report of the Council, Part VIII, on Legislation, has a recommendation to make on this same subject concerning the adoption of an attitude toward a chiropractic bill. I would suggest that since the matter will come up again it might be worth while to await that report.

SPEAKER BAUER: Do you move that we postpone action on this matter until the Report of the Reference Committee on the Report of the Council, Part

VIII, on Legislation, is brought in?

Dr. Wolff: Yes.

... The motion was seconded, and as there was no discussion, it was put to a vote, and was carried.

SPEAKER BAUER: It is so postponed.

DR. JOSEPH S. LAWRENCE: May I be permitted

to make a statement, Mr. Speaker?

Speaker Bauer: Pertaining to this matter?

Dr. Lawrence: Yes.

Speaker Bauer: It has already been postponed. Dr. LAWRENCE: It was not strictly pertaining to this matter, but pertaining to a remark made by Dr. Werne. I would like to make a statement on that.

SPEAKER BAUER: If there is no objection, the Chairman will grant Dr. Lawrence the floor.

.. No dissent was expressed...

Dr. Lawrence: Dr. Werne gave it as his opinion that when he appeared before the Chiropractic Legislative Commission that there was not a man there among the members of the Commission who was not sympathetic to chiropractic. That, however, should be modified in this way: that not all of the members of that investigating committee were supporters of chiropractic-for two members refused to sign the report.

In defense of the Legislature I should also like to say right now that the legislators are not all for chiropractic. A majority, and a strong majority, are supporting medicine, and if we stand by them,

they will stand by us.

SPEAKER BAUER: Go shead with the report of your Reference Committee, Dr. Eggston.

fore a magistrate's court. In the City of New York they are brought before the Court of Special Sessions, and there we get action. Upstate they are brought before a magistrate's court, with six jurors. In many cases those jurors happen to be friends of the chiropractor being accused, so you cannot get a decision against the chiropractor. The Attorney General's Department has found this weakness also, so the proper move, in my opinion, would be to have the law changed, if that is possible. When I say that, I am over my head, and I would have to turn to Mr. Martin or Mr. Clearwater as to the legal possibilities of having the law so changed that these cases would be tried in some other forum than the magistrate's court.

DR. LAURANCE D. REDWAY, Westchester: Speaking for this resolution, it seems that the discussion which has been provoked by its mere reading in the House is sufficient warranty for this House's passing

favorably upon it.

It is true, I think by common consent, that the law is not being enforced. The reasons for it may be various; however, the matter of calling it to the attention of the Governor and of the Legislature cannot possibly do any harm, and if the discussion in the Legislature by virtue of the passage of this resolution can be made more or less comparable to what has occurred here in the House maybe we will get something done about it, as Dr. Lawrence says. in the matter of revising the law so that it can be enforced. At any rate, as long as it is on the statute books there is no reason, as far as I can see, not to request the authorities to enforce it as far as they can. That is all I have to say.

Dr. CHARLES F. McCARTY, Kings: I just want to state that in Kings County about two weeks ago a chiropractor was convicted in the county court before a jury, and has been sentenced to sixty days in

jail. (Applause)

Dr. Eugene H. Coon, Nassau: I am not of a legal mind, but I cannot understand why the Medical Practice Act cannot be enforced against the chiropractor just as it would be enforced against the medical man. If one of us tried to practice medicine without being registered, we would be hauled up before the State Department and summarily dealt with. What happens with the chiropractor in the courts is They arrest the chiropractor, and then try chiropractic as a method of treatment, and they do not try the chiropractor for practicing in violation of the Medical Practice Act. I think that if they would try him for violation of the Medical Practice Act there would be no need of bringing in character witnesses as to the kind of treatment he gave and how much good he did somebody. We will all how much good he did somebody. grant that they do good.

Chorus: No, we won't.

Dr. Coon: Just for the sake of an argument.

CHORUS: Oh, that's different.

Dr. Coon: But the thing is they are practicing in violation of our Medical Practice Act, which requires that they must pass certain specified examinations. It seems to me that the lawyers and the courts are at fault rather than the Act itself.

DR. HOMER J. KNICKERBOCKER, Ontario: If they can convict a chiropractor in Brooklyn, they surely have no farmers on the jury there. The statement that has just been made indicates that the investigation into the chiropractic laws recently conducted was on the same plan by the Special Committee of the Legislature: they tried chiropractic, not the law. Dr. Albert F. R. Andresen, Kings: I have a sad

note with which to supplement what Dr. McCarty

has said. I read in the newspapers last week that this chiropractor had gone to a higher judge, who set the verdict temporarily aside, saying that there was some kind of bias in the decision, and that it was going to be tried in some higher court, so the chiro-

practor is now at large. (Laughter)

Dr. Madge C. L. McGuinness, New York: I understand that the Governor wants an absolutely perfect Medical Practice Act. Therefore, I suggest that we ask him to appoint a Moreland Act Commission to investigate this matter of chiropractic

and the Medical Practice Act.

DR. HARRY ARANOW, Bronx: I am sorry to speak again on this same subject, but the words "Moreland Act Commission" give me the creeps. (Laughter)

The reason I oppose the resolution is that I think we will accomplish nothing by it. As a former Chairman of the State Society's Committee on Legislation I can tell you that the chiropractic pressure has been tremendous for years, and I am sure it still is. If we cannot accomplish anything constructive, let us leave things alone, for we are likely to stir up trouble without accomplishing anything.

DR. JACOB WERNE, Queens: Would it be in order to introduce an amendment to that resolution to this effect: that the Governor be told that the legal facilities of our State Society, whatever legal talent we have, are available to him for advice on how this

Medical Practice Act can be enforced?

I should like to add this: I appeared before this recent legislative commission on chiropractic, and was convinced that there was not a man on that commission investigating chiropractic who was not antagonistic to medicine and in favor of chiropractic. I believe it is a very serious problem, and one that we should approach carefully and immediately. It will need a lot of the right sort of publicity in this State.

Speaker Bauer: Do you make that as an amendment to the motion?

Dr. Werne: Yes.

...The motion was seconded.....

SPEAKER BAUER: Dr. Werne has amended the motion calling for the adoption of the modified resolution by adding to it that we offer the services of our legal advisers to the Governor in helping to enforce the provisions of the Medical Practice Act. Is there any discussion on the amendment?

DR. JAMES F. ROONEY, Albany: I think that would be one of the suddest things we could possibly do. I have been fighting this chiropractic legislation since 1911. We have thus far succeeded in keeping chiropractors from being licensed in the State of New York, but the key that always opens the door for them and gives opportunity for legislators who are in favor of chiropractic to begin with is the claim that the organized medical profession is jealous of the enormous success that the chiropractors have with patients that the medical profession cannot cure. They always bring in horrible examples that have been cured by chiropractic. It is the same old patent medicine idea, the same old testimonial basis, year after year.

If you want to know the crux of the situation, it is this: The reason we have chiropractors in the State of New York today is that the medical profession has never exerted the united effect of their influence upon the legislators the way the chiropractors have. The Legislative Committee of this State Society has never been supported as a whole by its Society. If any attempt is made to in any way estop the chiropractors in the violation of the Medical Practice Act, every legislator in this State will have from

Section 46 (Sec 19)

Report of Reference Committee on New Business C-Noninclusion of X-Ray and Anesthesia in Any Hospital Service Plan

DR J STANLEY KENNEY, New York The following resolution was introduced by the Medical Society of the County of Erie.

"Whereas, a motion was made, seconded, and carried that the Medical Society of the County of Erie solicit the aid of the State Society against the inclusion of x-ray and anesthesia in any hospital service plan, therefore be it "Revolved, that the State Society establish a defi-

nite stand on this matter?

Your Reference Committee calls attention to the section on Hospital Insurance and Medical Service in the Report of the Planning Committee for Medical Policies This report covers in detail the substance of this resolution and reaffirms its complete accord with the resolution adopted by the House of Delegates of the American Medical Association in June, 1943 It feels that these medical service features properly belong in a Medical Expense Indem-mty Insurance Plan We, therefore, believe that in the adoption of the Planning Committee's report this House of Delegates will have set up its position and stand in this matter We, therefore, recommend that this resolution be tabled, and I so move

The motion was seconded, and as there was no discussion, it was put to a vote, and was unan-

imously carried

Section 47. (See 25)

### Report of Reference Committee on New Business C-Recruitments for New York State Guard

DR J STANLEY KENNEY, New York The following resolution was introduced by Dr Laurance D The follow-Redway, of Westchester County, and has as its subject "Recruitments for the New York State Guard".

"WHEREAS, the New York State Guard is seriously in need of officers as well as enlisted

personnel, medical as well as line, and "Wheneas, the evistence of the New York State Guard is required by the constitution of the

State and

"WHEREAS, more and more Federal troops are removing from the area of the continental United States, and thereby the State Guards of all states become of greater importance as the first line of defense in any internal disturbance, be it from Fifth Column activities or the disasters of nature.

"Resolved, that the Medical Society of the State of New York urges every physician in New York State to apply immediately to his nearest unit of the New York State Guard to ascertain whether or not his services are needed and be it further

"Resolved, that every physician in the State of New York contact as many individuals as possible in his territory between the ages of 17 and 55 with the view of urging them to enlist immediately in the Guard for training in either medical or line-troop duty "

The Reference Committee is in full accord with the intent and purpose of this resolution as presented and recommends its approval and adoption

I so move

The motion was seconded, and as there was no discussion, it was put to a vote, and was unammously carried

(See 27) Section 48

Report of Reference Committee on New Business C-Appointment of Reference Committees of American Medical Association

DR J STANLEI KENNEY, New York The following resolution was presented by Dr C James I Parsons, of Westchester County, and has as its subject "Appointment of Reference Committees of American Medical Association"

"Where is, Section 1 of Chapter X of the Bylaws of the American Medical Association provides that 'immediately after the organization of the House of Delegates at each annual session, the Speaker of the House of Delegates shall appoint from the members, unless otherwise provided, the chairman to be specified by the Speaker These Committees shall serve during the session at which they are appointed,' and

"Whereas, in the interest of assuring proper representation to various opinions and viewpoints in the personnel of reference committees dealing with major policies or controversial questions, it would seem desirable that the House of Delegates have an opportunity to pass upon the appointments to these committees as proposed by the

Speaker of the House, therefore, be it "Resolved, that the Delegates from the Medical Society of the State of New York to the House of Delegates of the American Medical Association be instructed to present a proposed amendment to the Bylaws of the American Medical Association whereby the following sentences would be added to Section 1, Chapter X, of the Bylaws as above quoted "The proposed appointments to all reference committees shall be submitted to the House of Delegates for approval and confirma-tion by a majority of the Delegates present Members of the House of Delegates shall then have an opportunity to offer motions for removal or addition of names of individual delegates for any of these committees, before it shall be confirmed by the House of Delegates"

The Reference Committee has given its careful thought and deliberation to the proposed changes and recommendations as embodied in this resolution We feel that if the provisions of this resolution were accomplished it would only serve to confuse and delay the normal working of the House of Delegates of the American Medical Association further, that the Speaker of the House of Delegates of the American Medical Association, an elected officer, has been placed there because the membership of that House has full confidence in his ability, fairness, and integrity We believe that the present method of conducting the business of the House of Delegates tends to bring about the most in efficiency and conduct of the many complex activities of the Association, and feel that it should not be disturbed We, therefore, recommend disapproval of this resolu-

I so move

The motion was seconded

SPEAKER BAUER. You have before you the report of the Reference Committee which recommends disapproval of the resolution If you vote "Aye" you disapprove of the resolution, if you rote "No" you approve it Is there any discussion?

DR ARTHUR S BROGA, Madison Being one of the little shots from upstate New York, I did not know I was to be a member of this Reference Committee on New Business A, and when I learned about it I was very much pleased However, if it were Section 44. (Sec 18)

Report of Reference Committee on New Business B—Women Medical Students and Interns

Dr. A. A. Eggston, Westchester: This is a resolution introduced by Dr. Emily Dunning Barringer, of New York County, reading:

"Whereas, the Medical Society of the State of New York has had the vision and courage to endorse and expedite the securing of commissions in the Medical Corps of Army and Navy, for women physicians; and

"WHEREAS, the satisfactory commissioning of women physicians in the Medical Corps depends on a supply of well-trained applicants; and

"WHEREAS, the premedical and medical education of women physicians has been seriously affected by the accelerated medical educational program of the Army and Navy, in which the best interests of the women physicians have been ignored, and there is no national standardization in regard to the status of the woman medical student, she being in the position of the proverbial stepchild, while the man medical student is receiving every educational and monetary consideration from the government; and

"Whereas, the woman physician is held equally responsible in the eyes of the law, because the same license to practice medicine is issued to her as to her brother colleague; therefore be it

"Resolved, that the Medical Society of the State of New York appoint a special committee to study the problem of the status of the woman medical student and intern; that this committee be instructed to evaluate the many difficulties of the problem, and have power to act to correct them; further, that on this committee there should be at least two women physicians who are known to be vitally interested in the matter, and that one of these women should be the incoming president of the American Medical Women's Association, who is a member of our Society."

Your Reference Committee on New Business B suggested a modification of this resolution, and discussed the matter with Dr. Barringer, and she was in agreement with the modification.

Your Reference Committee wishes to offer a modified resolution, as follows:

"Whereas, the Medical Society of the State of New York has had the vision and courage to endorse and expedite the securing of commissions in the Medical Corps to Army and Navy for women physicians; and

"Whereas, the satisfactory commissioning of women physicians in the medical corps depends on a supply of well-trained applicants; and

"Whereas, the premedical and medical education of women physicians has been seriously affected by the accelerated medical educational program of the Army and Navy, in which the best interests of the women physicians have been ignored, while the man medical student is receiving every educational and monetary consideration from the government;" and

(From that paragraph there was omitted, "and there is no national standardization in regard to the status of the women medical student, she being in the position of the proverbial stepchild." We deleted those phrases.)

"Whereas, the woman physician is held equally responsible in the eyes of the law because the same license to practice medicine is issued to her as to her brother colleague; therefore be it

"Resolved, that the Medical Society of the State of New York appoint a special committee of five" (The number was added.)

"to study the problem of the status of the woman medical student and intern; that this committee be instructed to evaluate the many difficulties of the problem and to report their findings and recommendation to the Council of the Medical Society of the State of New York; further, that on this Committee there should be at least two women physicians who are known to be vitally interested in the matter, and that one of these women should be the incoming president of the American Medical Women's Association, who is a member of our Society."

Your Reference Committee on New Business B moves the adoption of this modified resolution.

....The motion was seconded, and as there was no discussion, it was put to a vote, and was unanimously carried.....

Section 45. (See 29)

Report of Reference Committee on New Business C-Promotion of Working Relationship with State Agencies

Dr. J. Stanley Kenney, New York: The following resolution was introduced by Dr. Ralph T. B. Todd, of Westchester, and has as its subject "Promotion of Working Relationship with State Agencies":

"Whereas, His Excellency, the Governor, in his annual message, recognized that the State 'has an essential function' in meeting the needs of its citizens for good medical care; and

"Wherbas, the Medical Society of the State of New York has notified the Governor, by means of a letter from the Council of the Society, that its membership is ready and willing to cooperate in every possible way with the State government, in order to assure to all citizens of the State

adequate and effective medical care; and
"Whereas, various committees of the Medical
Society of the State of New York have established
close working relationships in recent years with
various departments of the State government;

therefore, be it

"Resolved, that the House of Delegates approves
the efforts of the Council, through its various
appropriate committees, in furthering these relations and in assisting the State government in
every feasible way to accomplish the objectives
set forth by Governor Dewey in his annual message—namely, 'a partnership of government and
the medical profession functioning cooperatively
in the interests of public health and welfare,
without endangering medical standards, threatening the professional interests of the practitioner
or the financial capacity of our people."

The Reference Committee believes that this resolution expresses adequately and properly the sentiments of the membership of the Medical Society of the State of New York and recommends the approval of the resolution. It also recommends that a copy of this action by the House of Delegates be forwarded to the Governor in further confirmation of a letter already dispatched from the Council of the Society.

I so move.

... The motion was seconded, and as there was no discussion, it was put to a vote, and was unanimously carried.....

# Woman's Auxiliary

# To the Medical Society of the State of New York

#### Convention News

THE Eighth Annual Convention of the Woman's Auxiliary to the Medical Society of the State of New York was held May 8-10, 1944, at the Hotel

Pennsylvania, New York City.

All of the meetings but the postconvention meeting were held in the Roof Garden. The postconvention meeting was held in the Keystone Room on the Balcony Floor. The reports from the State Executive Officers and the county presidents were

read and received with much interest.

Mrs. F. Leslie Sullivan opened the convention and presided at all meetings in a most gracious and efficient manner. The invocation was given by Rev. Kermit Castellanos, of St. Bartholomew's Church, Brooklyn. The salute to the flag was led by Mrs. B. G. Shults, Herkimer. Mrs. T. DeAngelo, Jackson Heights, welcomed the delegates and visi-tors to the Convention. Mrs. Bradford F. Golly, Utica, gave the response to the welcome. The well-organized convention program, which we all enjoyed, was the result of the untiring efforts of Mrs. B. D. St. John, Port Washington. Mrs. A. A. Jaques, Lynbrook, was the Credential Chairman. The following Woman's Auxiliary Pledge was re-

"I pledge my loyalty and devotion to the Woman's Auxiliary to the American Medical Association. I will support its activities, protect its reputation, and sustain its high ideals."

peated by all present, at the opening session:

Mrs. C. R. Seymour, Binghamton, directed a

very beautiful and impressive memorial service. After the election of officers Mrs. Sullivan presented the gavel to Mrs. Carlton E. Wertz, Buffalo, the newly elected President. At the postconvention meeting plans were formulated for a very active and interesting year. The speakers were Mrs. Eben J. Carey, Wauwatosa, Wisconsin, the National Auxiliary President. Mrs. Carey was presented by Mrs. Luther H. Kice. Monday afternoon an address was given by Dr. T. A. McGoldrick, President of the Medical Society of the State of New York for 1943—

Dr. L. H. Bauer, Hempstead, gave us information on legislation. Dr. Chas. Gordon Heyd gave a clear picture of the Physicians' Home project. Dr. Herbert H. Bauckus, President of the Medical Society of the State of New York for the year 1944-1945, addressed the postconvention meeting. Dr. Bemis Hood, Buffalo, also spoke at the post-

convention meeting.

Upon our return home we have many memories of the luncheon, dinner, Monday evening's enter-tainment, "The Boys and Girls from Manhasett," along with Miss Ann Delafield's demonstration— all of which offered relaxation and much-needed diversion. Old friendships were renewed and new friends were made. It is most important that we keep our Auxiliary active and ready to help in all of the present wartime and postwartime activities.

We wish Mrs. Carlton E. Wertz, our newly elected President, a most successful year.

### TIME TO PAY THE DOCTOR

One way to curb inflation, the government reminds us, is to take excess spending money off the market by paying outstanding debts. If this is correct, it is safe to say that settlement of old, neglected medical bills would constitute a sturdy hedge against inflation. What better time for tactful but firm measures to collect those overdue accounts?-J. Med. Soc. Co. N.Y.

dependent upon a vote of the combined organization of the Medical Society of the State of New York probably some big shot from New York City would thunder, "Let us put somebody else in." That was That was

my reasoning.

I think we should give every confidence to the Speaker of the House in his selection of committees. That should apply to the New York State Society, and it should also apply to the American Medical Association. We ought also to give our confidence to the Speaker of the American Medical Association, so whomever he recommends should get our O.K. If the Speaker does not do his work satisfactorily, but puts in a lot of men who are unsuitable on these committees, like the old men of the Supreme Court, we can disbar him. I am not in favor of this resolution.

.... The question was called for, and the motion was put to a vote, and was unanimously carried.... SPEAKER BAUER: The resolutions are lost.

Section 49. (See 21)

Report of Reference Committee on New Business C-1945 Annual Meeting

DR. J. STANLEY KENNEY, New York: This resolution concerns the 1945 Annual Meeting:

"WHEREAS, the 1943 Annual Meeting of the Medical Society of the State of New York was a great success in Buffalo; and

"Whereas, Dr. Herbert H. Bauckus, your President-Elect, is a Buffalonian; and

"Whereas, the Medical Society of the County of Erie would deem it an honor and privilege to have its colleagues convene there again; therefore be it

"Resolved, that the Medical Society of the County of Erie extends an invitation to the Medical Society of the State of New York to hold

its 1945 Annual Meeting in Buffalo."

Your Reference Committee recommends to the House of Delegates that it accept the kind invitation of the Medical Society of the County of Erie to hold the 1945 Annual Meeting of the American Medical Society of the State of New York in Buffalo, and desires to express the thanks of the House to this Committee for this privilege.

I so move.

... The motion was seconded, and as there was no discussion, it was put to a vote, and was unanimously carried .....

### PRESCRIPTION WRITING

One of the most difficult problems in the teaching of medical students is that of prescription writing. Perhaps no single facet of medical instruction is so frequently the butt of adverse criticism, not only from physicians themselves but from those responsible for compounding prescriptions, namely, pharma-Those who teach pharmacology to medical students are well aware of this situation, and many have been the methods used in attempting a solution. In this connection it may be of interest to outline briefly a plan which is being tried at the Medical College of Viiginia

A prescription is a message from a physician to a pharmacist, and so the better these two understand one another the more smoothly will this message be interpreted and executed. With this in mind, the school of pharmacy here at the college was asked some several years ago to aid in the teaching of prescription writing to our medical students This

cooperation was gladly given. At present, during the regular pharmacology course eight lectures are given by Dr. T. D. Rowe and Dr Karl Kaufman, in which the more common pitfalls and errors of prescription writing, as the pharmacist sees them, are brought to the attention of the medical students In addition, other problems of mutual concern, such as, for instance, the intricacies of the narcotic laws, are discussed. While this program has now been in progress too short a time for final evaluation, it is already evident that this addition to the teaching of medical pharmacology is bearing fruit, and it is planned to continue this cooperative scheme on a more elaborate scale in the coming years Fundamentally this would seem to be a sensible and logical procedure and for us here at the college, because of our unique organization, an especially feasible plan.—Harvey B Haag, in the Virginia Pharmacist

#### "Fatigue" Fracture or "March" Fracture

March fracture, recognized for many years, has under wartime conditions become a subject of re-newed interest. It has been found to occur not only in the metatarsals, as the earlier reports would suggest, but in other weight-bearing bones as well. Since 1938, cases have frequently been recorded as occurring in the tibia, fibula, and femur, and more rarely in the pelvis and spine. Most of the earlier writers contented themselves with the designation "march fracture," or simply "march foot," in reference to the occurrence of the condition chiefly among soldiers subject to long and unaccustomed marches. Recently certain writers have used instead the term "fatigue" or "stress" fracture.

Hartley1 in a recent contribution strongly recommends the name "fatigue fracture." He believes the condition is analogous to the fatigue fracture occurring in metals subject to increasing stresses and quotes Henschen's observation that by spectroradiographic methods exhaustion fractures have been shown to occur in bone under prolonged stress without adequate rest periods. He reserves the term for those cases in which a partial or complete fracture can be shown radiographically in apparently normal bone or in which a submicroscopic or molecular fracture can be inferred from the presence of callus or the subsequent history. There must be no systemic disease present which could cause bone weakness, and there must be no history of violence.

Hartley, like others, calls attention to the curiously low incidence of fatigue fracture in both America and Great Britain, where, until recently at least, only scattered examples have been recorded, in contrast to the large numbers of cases encountered in

Finnish, Swedish, Norwegian, and German recruits. By some these fractures have been confused with the pseudo-fracture of Looser but, as Hartley points out, they are quite different and entirely unrelated. Ode, they are duties occur in diseased bone; they often involve nes; they are often involve and may remultiple, produ main static for other hand, are found in which harries being of normal texture; they are a wally much and are characterized by abundant collection through the fracture itself may be barely proportion. The type occurring in the foot usually involves the shaft of the second or third metatarsal, less often the fourth, and rarely the fifth.

Krause' divides the syndrome into four stages: (1) During the first week or ten days following the onset of symptoms, the roentgenogram may show only a narrow fracture line or possibly none at all. (2) In from one to three weeks after onset, a spindleshaped callus formation is seen about the affected area and a fracture line is often visible. (3) Later, after immobilization, the callus is more sharply circumscribed and denser. The fracture line may still be visible. (4) The end result is a slightly thickened cortex.

Reports from army camps indicate that large numbers of these fractures are now being seen. Krause' has encountered more than 200 cases. The consensus of opinion attributes the fracture to repeated mechanical stresses of such character that their summation exceeds the physiologic strength of the bone. The onset of symptoms is usually gradual but may be abrupt. In the metatarsal area

there is gradually increasing discomfort when the body weight is placed on the foot, which may increase to the point of complete disability. Swelling and edema, especially on the dorsum of the foot, are frequently associated. Treatment is by immobilization and relief of weight-bearing, with gradual re-

turn to full activity.

Fatigue fractures do not appear to have been reported in the tibia until 1938, but since that time a number of such cases have been published. Krause<sup>1</sup> reported four examples in soldiers. The most common site appears to be at the junction of the middle and upper thirds of the tibia. The fracture is usually incomplete, but may progress to a complete fracture following a relatively slight injury. There is no soft tissue swelling and no osteoporosis. Most of the callus is seen posteriorly and medially, indicating that bone proliferation tends to follow the line of greatest stress.

Hartley1 calls attention to the fact that lateral roentgenograms of the tibia indicate that the maximum transmission of weight is posterior to the long axis of the tibia, as the bony architecture shows stress lines to be accentuated in the triangular area behind the midpoint of the internal condyle. These lines meet at the cortex, about 3 inches below the condyle, very near the point of origin of these frac-tures. This is taken as additional evidence that the

fractures are due to bony fatigue or exhaustion.

A case of "fatigue" fracture of the femur has been reported by Peterson. This was in a 17-year-old boy, who experienced sudden pain during exercise after a lengthy period of inactivity. A roentgenogram disclosed a slight crack in the femoral cortex. Later a diagnosis of bone tumor was made, but progressive callus formation finally clinched the diagnosis of fracture.

Jones, in a recent report, describes "march" fractures of the inferior public ramus occurring in three soldiers. They complained of gradually developing pain along the adductor aspect of the thigh following exercise, with no history of trauma. All made satisfactory recoveries following simple bed rest.

A case of "exhaustion" fracture of the spine is reported by Hartley, who believes that excessive overloading was the contributing factor. It occurred in a boy 17 years of age who was carrying sacks of coal weighing 100 pounds on his back. The pain came on suddenly and was acute in nature. Roentgenograms showed compression of the fifth dorsal vertebra. This narrowing of the vertebra increased during a one-week interval when there was no attempt at extension of the spine.

The frequent reports of fatigue fractures during the past five years emphasize the role which ab-normal stresses play in their etiology. Most of the cases have occurred in recruits in the military serv-

ice, who were subjected to unaccustomed physical tasks. It should be noted that nearly all of the patients are young persons. Differentiation of these tractures from sarcoma, which has been seriously considered in several of the reported cases, is especially important. Callus formation is a prominent feature and is often out of all proportion to the ex-

tent of the fracture. Radiologists must be on their guard to recognize the condition, especially in view of the compensation angle. Finally, a standardized name should be adopted. "Fatigue" fracture, as advocated by Hartley, would seem to be acceptable from both an etiologic and descriptive point of view.—Radiology, April, 1944

#### RESEARCH CENTER IN COSTA RICA TO DEVELOP CINCHONA

Plans have been made for the planting of about 100,000 cinchona seedlings by the Inter-American Institute of Agricultural Sciences at Turrialba, Costa Rica, to aid in the development of a quinine-producing industry in Latin America.

This has been announced in Washington by Earl N. Bressman, director of the Institute, which was established last year as an inter-American agricultural research and development center.

The seedlings destined for planting in Costa Rica are plants grown from part of 2,000,000 cinchona seeds which were taken out of the Philippine Islands in a flying fortress by Colonel Arthur F. Fischer just before the fall of Bataan to the Japanese.

Colonel Fischer is now liaison officer of the War Department with the United States Office of Foreign Economic Administration, which is cooperating with the other American republics in the expansion of the cinchona industry in the Western Hemisphere to help replace quinine supplies lost in the Far East.

The seedlings are of the high-yielding Ledgeriana type developed in the Far East from cinchona stock originally brought from South America, the home of the cinchona tree. The seeds snatched from under the noses of the Japanese in the Philippines have been planted temporarily at a United States

government plant station at Glendale, Maryland, from where they are being distributed to Latin America for the expansion of einchona planting.

The arrangements for the planting of 100,000 scedlings at Turrialba, made in cooperation with the War Department and the Foreign Economic Administration, involve the largest single transplanting resulting from the Philippine stock. Previously, a trial lot of 1,000 of the seedlings had been sent to Turrialba.

"The first batch of seedlings has done so well in Costa Rica, it is logical to undertake a larger-scale operation," said Dr. Bressman. "The development of a cinchona-growing industry is well under way in Latin America. I have great expectations for the establishment of quinine production in the Western Hemisphere on a solid and permanent basis."

Cinchona seedlings from Colonel Fischer's stock have been distributed widely in Latin America. Among the recipients have been Peru, Brazil, Mexico, Guatemala, Ecuador, Colombia, El Salvador, and Nicaragua.

Many of the seedlings have been shipped to new agricultural experiment stations set up in some of these countries with the cooperation of the United States.—Release from the Office of the Coordinator of Inter-American Affairs

#### GADGETS DEPRECIATE CLINICAL SKILL?

Every one well remembers the adage of former Vice-President Thomas Riley Marshall, who once said: "What this country needs is a good five-cent cigar." This could be paraphrased to: "What cardiology needs is a simplified book for the general practitioner." This take off on the vice-president's adage repeatedly recurred in the mind of the writer while he read carefully various books and articles on the subject. There is a definite need today for a manual that will simplify the problem of heart disease for those who find the subject to be too complex and extensive in current publications.

Many books have been written for those who have access to all the facilities and new gadgets which the modern cardiologist thinks are necessary to make an adequate diagnosis in heart disease. All this notwithstanding, the late H. A. Christian made this significant observation: "Blind dependence on any instrument or laboratory procedure can but have a numbing and depreciating influence on the clinical skill of the internist."

In our opinion it is very unfortunate that instrument-maker cartels and other restraining influences have made remote the possibility of the general practitioner's owning an electrocardiograph or a fluoroscope. It is our fervent hope, when this present holocaust is over, that with the newer advances in electronics and better merchandizing facilities based on the greatest need for the greatest number, more practitioners may possess some of the gadgets that are now in the hands of the few.

Then the general practitioner who will have had better training in his medical school days may become as well versed in the interpretation and meaning of an electrocardiogram or a chest plate as his specialist brother is today.

This newer knowledge of electrocardiography is now in the same status as studies in blood chemistry were in relation to general medicine at the turn of the present century.—G. M., in Pennsylvania M. J., March, 1944

#### CARTHAGO DELENDA EST.

When Joshua blew his trumpets before Jericho, according to a source of information usually considered reliable, the walls came tumbling down. Troy went up in flames after the fifth column of the Greeks had penetrated its inner defenses. Nineveh and Tyre became one with the pomp of yesterday, and the merciful jungle has crept in to cover the bones of many an ancient city. After the second Punic War, when Hannibal had finally been driven from Italy, the elder Cato had only one ending for his speeches: Carthago delenda est—"Carthage must be destroyed;" and eventually that city, which had threatened the security of Rome, was erased from the map so thoroughly that corn could be planted over its ruins.

History repeats itself. Germany, for a century the scourge of Middle Europe, had prepared herself and had every intention of waging a destructive warfare on her European neighbors, if not on all the world that resisted her. Warsaw was destroyed. Rotterdam was laid waste in cold cruelty, after its surrender; the same would have happened to the cities of England if Goering had not overestimated

the power of the Luftwaffe.

After years of desperate heroism the tide has turned, and it is the nations allied against Germany that have the mounting air power to destroy the cities of that rebellious nation. Berlin is being laid waste, and the job will be carried through to the

finish. A moral question is now being raised, and many shocked persons, here and in England, are crying out against the violence and the mercilessness of this growing counterattack. We must not put ourselves in the category of those who make war on civilian populations, they say, and vengeance belongs to the Lord. (There is an equally applicable aphorism that those who live by the sword must perish by the sword.) That able commentator, Raymond Gram Swing, has taken occasion to answer these horror-stricken protestants: in the destruction of Berlin we are not primarily making war on her civilian population, on her women and children, but we are seeking to destroy Germany's power to make war against the world.

These pacifistic peacemakers are not the only ones who have feelings of guilt over the course the war has taken; millions of us have feelings of remorse. But they are not concerned with the destruction of Berlin; they are over our failure in the past to have taken the obvious steps necessary to prevent this war from breaking out at all. They are because we failed to prevent Japan from taking Manchukuo, because we failed to protect Ethiopia from Mussolini; because we failed to save Czechoslovakia from Hitler in 1938. These are the misdeeds that we should repent—to have failed then to use force in order to prevent this violence now.—Editorial in New England J. M., March 30, 1944

#### "IVORY CROSS EXPEDITION" TO LIBERATED HOLLAND

American educators in the field of dentistry have interested themselves in a project to restore dental practice in Holland to its prewar level as speedily as possible after the country's liberation. Foremost among them is Dr. S. L. T. Appleton, dean of the School of Dentistry at the University of Pennsylvania. Under his leader-hip a unit will be formed which will give courses on dentistry at Utrecht University in Holland as soon as conditions permit. The courses are to last four weeks and will be prepared in advance, both in the English and Dutch languages. Dr. Appleton has appointed Prof. Lester W Burkert as leader of the committee, while the Netherlands government has commissioned Dr. Herbert Loeb, of Cambridge, Massachusetts, to cooperate with Dr. Burkert. Dr. Loeb is a graduate of Utrecht University and of the University of Pennsylvania's School of Dentistry.

Dean Appleton has already offered to put at the disposal of the committee all techni al books and

publications of which the school possesses more than one copy. All material and instruments needed for practical demonstration will be obtained in the United States; dental supply houses have already promised their cooperation.

The plan has the full approval of the Netherlands Minister of Education, Dr. Gerrit Bolkestein, who is at present in this country to study the American school system. The committee will be known as the "Ivory Cross Expedit on" in honor of the "Ivory Cross," Netherlands Association for the elimination of dental decay, of which Princess Juliana is honorary president.

Julians is honorary president.

There can be little doubt that undernourishment and lack of needed vitamins have caused much dental decay among the Dutch population, while the disruption of university life under the Nazis has made the study of dentistry, as well as of other branches of medicine, practically impossible.—

Release from the Netherlands Information Bureau

#### ALLIED FORCES DENTAL SOCIETY

The formation of an Allied Forces Dental Society, composed of leading dental surgeons of the Allied Nations, was recently reported by the American Dental Association. The society was formed for the purpose of pooling ideas to better the health of the fighting forces and to further postwar dental science, and more than 650 dental surgeons of the Royal Navy, Royal Air Force, and American, British, and Canadian armies have been admitted to

membership in the society. Major Richard H. Carnahan of Texas, Capt. Philip S. Brackett of Massachusetts, and Lieut. Comdr. E. S. Boden of Ohio with the help of British dental officials organized the new society, which was formed in London.

Internationally known dental surgeons give lectures at the society's monthly meetings on latest methods of treatment.—J.A.M.A., April, 1944

ice, who were subjected to unaccustomed physical tasks. It should be noted that nearly all of the patients are young persons. Differentiation of these fractures from sarcoma, which has been seriously considered in several of the reported cases, is especially important. Callus formation is a prominent feature and is often out of all proportion to the ex-

tent of the fracture. Radiologists must be on their guard to recognize the condition, especially in view of the compensation angle. Finally, a standardized name should be adopted. "Fatigue" fracture, as advocated by Hartley, would seem to be acceptable from both an etiologic and descriptive point of view.—Radiology, April, 1944

#### RESEARCH CENTER IN COSTA RICA TO DEVELOP CINCHONA

Plans have been made for the planting of about 100,000 cinchona seedlings by the Inter-American Institute of Agricultural Sciences at Turrialba, Costa Rica, to aid in the development of a quinine-producing industry in Latin America.

This has been announced in Washington by Earl N. Bressman, director of the Institute, which was established last year as an inter-American agricultural research and development center.

The seedlings destined for planting in Costa Rica are plants grown from part of 2,000,000 cinchona seeds which were taken out of the Philippine Islands in a flying fortress by Colonel Arthur F. Fischer just before the fall of Bataan to the Japanese.

Colonel Fischer is now liaison officer of the War Department with the United States Office of Foreign Economic Administration, which is cooperating with the other American republies in the expansion of the cinchona industry in the Western Hemisphere to help replace quinine supplies lost in the Far East.

The seedlings are of the high-yielding Ledgeriana type developed in the Far East from cinchona stock originally brought from South America, the home of the cinchona tree. The seeds snatched from under the noses of the Japanese in the Philippines have been planted temporarily at a United States

government plant station at Glendale, Maryland, from where they are being distributed to Latin America for the expansion of cinchona planting.

The arrangements for the planting of 100,000 seedlings at Turrialba, made in cooperation with the War Department and the Foreign Economic Administration, involve the largest single transplanting resulting from the Philippine stock. Previously, a trial lot of 1,000 of the seedlings had been sent to Turrialba.

"The first batch of seedlings has done so well in Costa Rica, it is logical to undertake a larger-scale operation," said Dr. Bressman. "The development of a cinchon-growing industry is well under way in Latin America. I have great expectations for the establishment of quinine production in the Western Hemisphere on a solid and permanent basis."

Cinchona seedlings from Colonel Fischer's stock have been distributed widely in Latin America. Among the recipients have been Peru, Brazil, Mexico, Guatemala, Ecuador, Colombia, El Salvador, and Nicaragua.

Many of the seedlings have been shipped to new agricultural experiment stations set up in some of these countries with the cooperation of the United States.—Release from the Office of the Coordinator of Inter-American Affairs

#### GADGETS DEPRECIATE CLINICAL SKILL?

Every one well remembers the adage of former Vice-President Thomas Riley Marshall, who once said: "What this country needs is a good five-cent cigar." This could be paraphrased to: "What cardiology needs is a simplified book for the general practitioner." This take off on the vice-president's adage repeatedly recurred in the mind of the writer while he read carefully various books and articles on the subject. There is a definite need today for a manual that will simplify the problem of heart disease for those who find the subject to be too complex and extensive in current publications.

Many books have been written for those who have access to all the facilities and new gadgets which the modern cardiologist thinks are necessary to make an adequate diagnosis in heart disease. All this notwithstanding, the late H. A. Christian made this significant observation: "Blind dependence on any instrument or laboratory procedure can but have a numbing and depreciating influence on the clinical skill of the internist."

In our opinion it is very unfortunate that instrument-maker cartels and other restraining influences have made remote the possibility of the general practitioner's owning an electrocardiograph or a fluoroscope. It is our fervent hope, when this present holocaust is over, that with the newer advances in electronics and better merchandizing facilities based on the greatest need for the greatest number, more practitioners may possess some of the gadgets that are now in the hands of the

few. Then the general practitioner who will have had better training in his medical school days may become as well versed in the interpretation and meaning of an electrocardiogram or a chest plate as his specialist brother is today.

This newer knowledge of electrocardiography is now in the same status as studies in blood chemistry were in relation to general medicine at the turn of the present century.—G. M., in Pennsylvania M. J., March, 1944

# **HYPERTENSION** CASUALTIES

. . . Renal **Failure** 

As a result of renal ischemia in nephrosclerosis, functional impairment of the kidney sets in, resulting eventually in renal failure and uremia.

To aid the reduction of blood pressure quickly without shock—and maintain the reduction physicians prescribe Natrico Pulvoids. This synergistic combination of vasodulators obtains full action of the nitrites, but avoids the disadvantages of the constituents when used alone.

#### SYMPTOMATOLOGY

Natrico Pulvoids are especially useful in the symptomatic treatment of essential hypertension and for relief of cardiac pain, headache, dizziness and finnitus due to arterial hypertension. Each Pulvoid contains: Potassium Nitrate, 2 grs., Sodium Nitrite 1 gr., Po. Ext. Crataegus Oxyacantha 1/4 gr., Nitroglycerin 1/250 gr. Supplied: Bottles of 100 Pulvoids.

Write Dept. 1 for samples and literature. THE DRUG PRODUCTS CO., Inc., Long Island City 1, New York.

## Vitamin "B" Complex fortified with Vitamin "C"

Research has shown that vitamins B and C appear to work as a team in effecting beneficial changes in cellular physiology. This was clinically manifested by improvement in pathology of the upper respiratory mucosa and the retina when the two vitamins were given together.

When only one was used, this favorable reaction did not occur.

Vitamin "B" Soluble (Walker) is derived from brewers yeast—its potency increased so that three capsules meet the minimum daily needs for vitamin B factors recommended by the U.S. Government.

Professional samples sent on request to Myron L. Walker Co. Inc., Mount Vernon, New York.

# PANTOTHENIC ACID LOSES ANOTHER ROUND

Further disillusionment of any miracle restoring color to the hair through pantothenic acid was made in a recent report by the Nutrition Foundation.

The hopes of many "silverlocks" that the biological clock might be turned back to the time when they were dark and handsome by dosing themselves with pantothenic acid has been dashed in Nutrition Reviews published by the Foundation. In animal experiments in which the graying of hair was produced by a pantothenic acid deficiency and the color restored by supplying pantothenates, the results were achieved only in young animals. Three groups of scientists who sought to transfer the results in young animals to adult humans failed to find anything resembling a restoration to natural color.

This leads Nutrition Reviews to the conclusion that "the extravagant claims which have been made for calcium pantothenate in relation to graying hair in man have no foundation."

#### IN THIS WAR IT'S "POOR COOTIE"

What wouldn't the 1917 veteran have given for the little 20-cc, ampule of methyl bromide used in this way

Seven and a half million of these "block-busters" of the cootie line have been supplied our armed forces.

The indication? Symptoms of lice.

The application? The 20-cc. ampules are issued to individual soldiers, who place them in the bottom of a gasproof "delousing bag." Then they place their clothes, and all the vermin and lice (the carrier of typhus) they might contain, into the bag, close it, kick the ampule or strike it with a rock to break it, and release the gas. When the clothing comes out of the bag, it is aired a few minutes, and the soldier puts it back on, secure in the knowledge that no unbidden guests are haunting the seams of his garment—methyl bromide does the job.

#### HEALTH IN THE "HEREAFTER"

Almost any condition in the immediate postwar era will be like heaven to a large portion of the world. Surpluses may create no concern for most of the warring nations-but how about the U.S.A.?

The first thought on the problem of a surplus was voiced by the publisher of Drug, Vitamin and Allied

Industries, in the March, 1944, issue.

"That there will be postwar surpluses is inevitable," remarks this publisher. "A Global War cannot be waged without "too much" of almost everything that might be required, ready if and when needed.

"Such surpluses will cause severe headaches to some industries, but this publication is convinced that the drug and allied industries will be less seriously affected than most. The reason is that there will be a world-wide need for our products, war or peace.

"We are not unmindful of the fact that need alone does not constitute a market; that willingness to buy must be backed by ability to pay before it becomes demand. Yet it is characteristic of America that the needy must be served, whether or not they

are able to pay. Certainly we shall not, as individuals or as a nation, soon change our 'thinking' in this respect in so far as it applies to health of our valiant allies or even the conquered. Our own safety we must consider, too!

"Our cover illustration, an official Navy photograph, suggests one outlet, if not actually a market in the ordinary sense, for any surplus health supplies. The suggested cut lines stated: 'Prompt recognition and treatment of infectious diseases not only earns for Uncle Sam the gratitude of the natives cured, but lessens the chance of epidemics spreading to those on duty in the area.'

"The word 'area' no longer connotes a small or isolated spot. No area on the globe which has, or is to have, an airport can be isolated. To prevent the spreading of epidemics, disease and infection carriers, we face the task of stamping them out in just one area. That area is the whole globe.

"We unreservedly hold the opinion that if we (as a political body) use our heads any seeming 'surplus' of health products will in fact be 'a shortage'; that production capacity will continue to be taxed to supply over-all demand."

A sanitarium devoted exclusively to the individual treatment of MENTAL CASES. Falkirk has been recom-mended by the members of the medi-neclusive for helf a continuous cal profession for half a century.
